## CHAPTER ONE

---

### OVERVIEW

Sushy is a Python library to communicate with [Redfish](#) based systems.

The goal of the library is to be extremely simple, small, have as few dependencies as possible and be very conservative when dealing with BMCs by issuing just enough requests to it (BMCs are very flaky).

Therefore, the scope of the library has been limited to what is supported by the [OpenStack Ironic](#) project. As the project grows and more features from [Redfish](#) are needed we can expand Sushy to fulfill those requirements.

- Free software: Apache license
- **Includes Redfish registry files licensed under** Creative Commons Attribution 4.0 License: <https://creativecommons.org/licenses/by/4.0/>
- Documentation: <https://docs.openstack.org/sushy/latest/>
- Usage: <https://docs.openstack.org/sushy/latest/reference/usage.html>
- Source: <https://opendev.org/openstack/sushy>
- Bugs: <https://storyboard.openstack.org/#!/project/960>

---

**CHAPTER  
TWO**

---

**FEATURES**

- Abstraction around the SystemCollection and System resources (Basic server identification and asset information)
- RAID in Redfish based Systems
- Redfish Ethernet Interface
- System mappings
- System processor
- Storage management
- Systems power management (Both soft and hard; Including NMI injection)
- Changing systems boot device, frequency (Once or permanently) and mode (UEFI or BIOS)
- Chassis management
- OEM extention
- Virtual media management
- Session Management

## DOCUMENTATION

### 3.1 Installing Sushy

At the command line:

```
$ pip install sushy
```

Or, if you have virtualenvwrapper installed:

```
$ mkvirtualenv sushy
$ pip install sushy
```

### 3.2 Contributing to Sushy

#### 3.2.1 How to contribute

If you would like to contribute to the development of OpenStack, you must follow the steps in this page:

<http://docs.openstack.org/infra/manual/developers.html>

If you already have a good understanding of how the system works and your OpenStack accounts are set up, you can skip to the development workflow section of this documentation to learn how changes to OpenStack should be submitted for review via the Gerrit tool:

<http://docs.openstack.org/infra/manual/developers.html#development-workflow>

Pull requests submitted through GitHub will be ignored.

Bugs should be filed in StoryBoard, not GitHub:

<https://storyboard.openstack.org/#!/project/960>

### 3.2.2 Running a Redfish emulator

Testing and/or developing Sushy without owning a real baremetal machine that supports the Redfish protocol is possible by running an emulator, the `sushy-tools` project ships with two emulators that can be used for this purpose. To install it run:

```
sudo pip install --user sushy-tools
```

---

**Note:** Installing the dependencies requires libvirt development files. For example, run the following command to install them on Fedora:

```
sudo dnf install -y libvirt-devel
```

---

#### Static emulator

After installing `sushy-tools` you will have a new CLI tool named `sushy-static`. This tool creates a HTTP server to serve any of the Redfish mockups. The files are static so operations like changing the boot device or the power state **will not** have any effect. But that should be enough for enabling people to test parts of the library.

To use `sushy-static` we need the Redfish mockup files that can be downloaded from <https://www.dmtf.org/standards/redfish>, for example:

```
wget https://www.dmtf.org/sites/default/files/standards/documents/DSP2043_1.0.0.zip
```

After the download, extract the files somewhere in the file-system:

```
unzip DSP2043_1.0.0.zip -d <output-path>
```

Now run `sushy-static` pointing to those files. For example to serve the DSP2043-server mockup files, run:

```
sushy-static --mockup-files <output-path>/DSP2043-server
```

#### Libvirt emulator

The second emulator shipped by `sushy-tools` is the CLI tool named `sushy-emulator`. This tool starts a ReST API that users can use to interact with virtual machines using the Redfish protocol. So operations such as changing the boot device or the power state will actually affect the virtual machines. This allows users to test the library in a more dynamic way. To run it do

```
sushy-emulator

# Or, running with custom parameters
sushy-emulator --port 8000 --libvirt-uri "qemu:///system"
```

That's it, now you can test Sushy against the `http://localhost:8000` endpoint.

## Enabling SSL

Both mockup servers supports [SSL](#) if you want Sushy with it. To set it up, first you need to generate key and certificate files with OpenSSL use following command:

```
openssl req -x509 -newkey rsa:2048 -keyout key.pem -out cert.pem -days 365
```

Start the mockup server passing the `--ssl-certificate` and `--ssl-key` parameters to it, for example:

```
sushy-emulator --ssl-key key.pem --ssl-certificate cert.pem
```

Now to connect with [SSL](#) to the server use the `verify` parameter pointing to the certificate file when instantiating Sushy, for example:

```
import sushy

# Note the HTTP"S"
s = sushy.Sushy('https://localhost:8000', verify='cert.pem', username='foo
˓→', password='bar')
```

## 3.3 Sushy Library Reference

### 3.3.1 Usage

#### Using Sushy

To use sushy in a project:

#### Specifying an authentication type

There are three authentication objects. By default we use `SessionOrBasicAuth`.

Authentication Modes:

- `auth.SessionOrBasicAuth`: Use session based authentication. If we are unable to create a session we will fallback to basic authentication.
- `auth.BasicAuth`: Use basic authentication only.
- `auth.SessionAuth`: Use session based authentication only.

```
import logging

import sushy
from sushy import auth

# Enable logging at DEBUG level
LOG = logging.getLogger('sushy')
LOG.setLevel(logging.DEBUG)
LOG.addHandler(logging.StreamHandler())
```

(continues on next page)

(continued from previous page)

```
basic_auth = auth.BasicAuth(username='foo', password='bar')
session_auth = auth.SessionAuth(username='foo', password='bar')
session_or_basic_auth = auth.SessionOrBasicAuth(username='foo',
                                                password='bar')

s = sushy.Sushy('http://localhost:8000/redfish/v1',
                auth=basic_auth)

s = sushy.Sushy('http://localhost:8000/redfish/v1',
                auth=session_auth)

s = sushy.Sushy('http://localhost:8000/redfish/v1',
                auth=session_or_basic_auth)

# It is important to note that you can
# call sushy without supplying an
# authentication object. In that case we
# will use the SessionOrBasicAuth authentication
# object in an attempt to connect to all different
# types of redfish servers.
s = sushy.Sushy('http://localhost:8000/redfish/v1',
                username='foo',
                password='bar')
```

## Creating and using a sushy system object

```
import logging

import sushy

# Enable logging at DEBUG level
LOG = logging.getLogger('sushy')
LOG.setLevel(logging.DEBUG)
LOG.addHandler(logging.StreamHandler())

s = sushy.Sushy('http://localhost:8000/redfish/v1',
                username='foo', password='bar')

# Get the Redfish version
print(s.redfish_version)

# Instantiate a system object
sys_inst = s.get_system('/redfish/v1/Systems/437XR1138R2')

# Using system collections

# Instantiate a SystemCollection object
sys_col = s.get_system_collection()

# Print the ID of the systems available in the collection
print(sys_col.members_identities)
```

(continues on next page)

(continued from previous page)

```
# Get a list of systems objects available in the collection
sys_col_insts = sys_col.get_members()

# Instantiate a system object, same as getting it directly
# from the s.get_system()
sys_inst = sys_col.get_member(sys_col.members.identities[0])

# Refresh the system collection object
#
# See below for more options on how to refresh resources.
sys_col.refresh()

# Using system actions

# Power the system ON
sys_inst.reset_system(sushy.RESET_ON)

# Get a list of allowed reset values
print(sys_inst.get_allowed_reset_system_values())

# Refresh the system object (with all its sub-resources)
sys_inst.refresh()

# Alternatively, you can only refresh the resource if it is stale by
# passing
# force=False:
sys_inst.refresh(force=False)

# A resource can be marked stale by calling invalidate. Note that its
# subresources won't be marked as stale, and thus they won't be refreshed
# by
# a call to refresh(force=False)
sys_inst.invalidate()

# Get the current power state
print(sys_inst.power_state)

# Set the next boot device to boot once from PXE in UEFI mode
sys_inst.set_system_boot_source(sushy.BOOT_SOURCE_TARGET_PXE,
                                 enabled=sushy.BOOT_SOURCE_ENABLED_ONCE,
                                 mode=sushy.BOOT_SOURCE_MODE_UEFI)

# Get the current boot source information
print(sys_inst.boot)

# Get a list of allowed boot source target values
print(sys_inst.get_allowed_system_boot_source_values())

# Get the memory summary
print(sys_inst.memory_summary)

# Get the processor summary
print(sys_inst.processors.summary)
```

## Creating and using a sushy manager object

```
import logging

import sushy

# Enable logging at DEBUG level
LOG = logging.getLogger('sushy')
LOG.setLevel(logging.DEBUG)
LOG.addHandler(logging.StreamHandler())

s = sushy.Sushy('http://localhost:8000/redfish/v1',
                username='foo', password='bar')

# Instantiate a manager object
mgr_inst = s.get_manager('BMC')

# Get the manager name & description
print(mgr_inst.name)
print(mgr_inst.description)

# Using manager collections

# Instantiate a ManagerCollection object
mgr_col = s.get_manager_collection()

# Print the ID of the managers available in the collection
print(mgr_col.members_identities)

# Get a list of manager objects available in the collection
mgr_insts = mgr_col.get_members()

# Instantiate a manager object, same as getting it directly
# from the s.get_manager()
mgr_inst = mgr_col.get_member(mgr_col.members_identities[0])

# Refresh the manager collection object
mgr_col.invalidate()
mgr_col.refresh()

# Using manager actions

# Get supported graphical console types
print(mgr_inst.get_supported_graphical_console_types())

# Get supported serial console types
print(mgr_inst.get_supported_serial_console_types())

# Get supported command shell types
print(mgr_inst.get_supported_command_shell_types())

# Get a list of allowed manager reset values
```

(continues on next page)

(continued from previous page)

```
print(mgr_inst.get_allowed_reset_manager_values())\n\n# Reset the manager\nmgr_inst.reset_manager(sushy.RESET_MANAGER_FORCE_RESTART)\n\n# Refresh the manager object (with all its sub-resources)\nmgr_inst.refresh(force=True)\n\n# Using Virtual Media\n\n# Instantiate a VirtualMediaCollection object\nvirtmedia_col = mgr_inst.virtual_media\n\n# Print the ID of the VirtualMedia available in the collection\nprint(virtmedia_col.members_identities)\n\n# Get a list of VirtualMedia objects available in the collection\nvirtmedia_insts = virtmedia_col.get_members()\n\n# Instantiate a VirtualMedia object\nvirtmedia_inst = virtmedia_col.get_member(\n    virtmedia_col.members_identities[0])\n\n# Print out some of the VirtualMedia properties\nprint(virtmedia_inst.name,\n      virtmedia_inst.media_types)\n\n# Insert virtual media (invalidates virtmedia_inst contents)\nvirtmedia_inst.insert_media('https://www.dmtf.org/freeImages/Sardine.img')\n\n# Refresh the resource to load actual contents\nvirtmedia_inst.refresh()\n\n# Print out some of the VirtualMedia properties\nprint(virtmedia_inst.image,\n      virtmedia_inst.image_path,\n      virtmedia_inst.inserted,\n      virtmedia_inst.write_protected)\n\n# ... Boot the system off the virtual media...\n\n# Eject virtual media (invalidates virtmedia_inst contents)\nvirtmedia_inst.eject_media()
```

## Creating and using a sushy client with Sessions

```
import logging

import sushy

# Enable logging at DEBUG level
LOG = logging.getLogger('sushy')
LOG.setLevel(logging.DEBUG)
LOG.addHandler(logging.StreamHandler())

s = sushy.Sushy('http://localhost:8000/redfish/v1',
                username='foo', password='bar')

# Get the ComputerSystem object (if there is only one), otherwise
# the identity must be provided as a path to the system.
system = s.get_system()

# A session is created automatically for you.
# Print the boot field in the ComputerSystem.
print(system.boot)

# Upon session timeout, Sushy recreates the session based upon
# provided credentials. If this fails, an exception is raised.

# Explicitly request a session_key and session_uri.
# This is not stored, but may be useful.
session_key, session_uri = s.create_session(username='foo',
                                              password='bar')

# Retrieve the session
session = s.get_session(session_uri)

# Delete the session
session.delete()
```

## Using OEM extensions

Before running this example, please make sure you have a Redfish BMC that includes the OEM piece for a specific vendor, as well as the Sushy OEM extension package installed in the system for the same vendor.

You can check the presence of the OEM extension within each Redfish resource by specifying the vendor ID and search for them.

In the following example, we are looking up “Acme” vendor extension to Redfish Manager resource.

```
import sushy

root = sushy.Sushy('http://localhost:8000/redfish/v1')

# Instantiate a system object
system = root.get_system('/redfish/v1/Systems/437XR1138R2')

print('Working on system resource %s' % system.identity)
```

(continues on next page)

(continued from previous page)

```
for manager in system.managers:

    print('Using System manager %s' % manager.identity)

    # Get a list of OEM extension names for the system manager
    oem_vendors = manager.oem_vendors

    print('Listing OEM extension name(s) for the System '
          'manager %s' % manager.identity)

    print(*oem_vendors, sep="\n")

try:
    manager_oem = manager.get_oem_extension('Acme')

except sushy.exceptions.OEMExtensionNotFoundError:
    print('ERROR: Acme OEM extension not found in '
          'Manager %s' % manager.identity)
    continue

print('%s is an OEM extension of Manager %s'
      % (manager_oem.get_extension(), manager.identity))

# set boot device to a virtual media device image
manager_oem.set_virtual_boot_device(sushy.VIRTUAL_MEDIA_CD,
                                    manager=manager)
```

If you do not have any real baremetal machine that supports the Redfish protocol you can look at the [Contributing to Sushy](#) page to learn how to run a Redfish emulator.

For the OEM extension example, presently, both of the emulators (static/dynamic) do not expose any OEM; as a result, users may need to add manually some OEM resources to emulators' templates. It may be easier to start with a static emulator.

LINE_INPUT_VOLTAGE_TYPE_ACLOW =  
'aclowline'  
100-127V AC input.
```

```
sushy.resources.chassis.power.constants.  
LINE_INPUT_VOLTAGE_TYPE_ACMID =  
'acmidline'  
200-240V AC input.
```

```
sushy.resources.chassis.power.constants.  
LINE_INPUT_VOLTAGE_TYPE_ACWIDE =  
'acwiderange'  
Wide range AC input.
```

```
sushy.resources.chassis.power.constants.  

LINE_INPUT_VOLTAGE_TYPE_DC240 =  

'dc240v'  

    DC 240V nominal input.  

  

sushy.resources.chassis.power.constants.  

LINE_INPUT_VOLTAGE_TYPE_DC380 =  

'dc380v'  

    High Voltage DC input (380V).  

  

sushy.resources.chassis.power.constants.  

LINE_INPUT_VOLTAGE_TYPE_DCNEG48 =  

'dcneg48v'  

-48V DC input.  

  

sushy.resources.chassis.power.constants.  

LINE_INPUT_VOLTAGE_TYPE_UNKNOWN =  

'unknown'  

    The power supply line input voltage type cannot be determined.  

  

sushy.resources.chassis.power.constants.POWER_SUPPLY_TYPE_AC = 'ac'  

    Alternating Current (AC) power supply.  

  

sushy.resources.chassis.power.constants.POWER_SUPPLY_TYPE_ACDC =  

'acdc'  

    Power Supply supports both DC or AC.  

  

sushy.resources.chassis.power.constants.POWER_SUPPLY_TYPE_DC = 'dc'  

    Direct Current (DC) power supply.  

  

sushy.resources.chassis.power.constants.POWER_SUPPLY_TYPE_UNKNOWN =  

'unknown'  

    The power supply type cannot be determined.
```

## [sushy.resources.chassis.power.mappings module](#)

### [sushy.resources.chassis.power.power module](#)

```
class sushy.resources.chassis.power.power.InputRangeListField(*args,  

**kwargs)  

Bases: sushy.resources.base.ListField  

This type describes an input range for a power supply  

  

input_type = <sushy.resources.base.MappedField object>  

    The Input type (AC or DC)  

  

maximum_frequency_hz = <sushy.resources.base.Field object>  

    The maximum line input frequency at which this power supply input range is effective  

  

maximum_voltage = <sushy.resources.base.Field object>  

    The maximum line input voltage at which this power supply input range is effective  

  

minimum_frequency_hz = <sushy.resources.base.Field object>  

    The minimum line input frequency at which this power supply input range is effective
```

```
minimum_voltage = <sushy.resources.base.Field object>
    The minimum line input voltage at which this power supply input range is effective

output_wattage = <sushy.resources.base.Field object>
    The maximum capacity of this Power Supply when operating in this input range

class sushy.resources.chassis.power.power.Power(connector, path="",
                                                 redfish_version=None,
                                                 registries=None, reader=None,
                                                 json_doc=None, root=None)

Bases: sushy.resources.base.ResourceBase

This class represents a Power resource.

identity = <sushy.resources.base.Field object>
    Identifier of the resource

name = <sushy.resources.base.Field object>
    The name of the resource

power_supplies =
<sushy.resources.chassis.power.power.PowerSupplyListField
object>
    Details of a power supplies associated with this system or device

class sushy.resources.chassis.power.power.PowerSupplyListField(*args,
                                                               **kwargs)

Bases: sushy.resources.base.ListField

The power supplies associated with this Power resource

firmware_version = <sushy.resources.base.Field object>
    The firmware version for this Power Supply

identity = <sushy.resources.base.Field object>
    Identifier of the Power Supply

indicator_led = <sushy.resources.base.MappedField object>
    The state of the indicator LED, used to identify the power supply

input_ranges =
<sushy.resources.chassis.power.power.InputRangeListField object>
    This is the input ranges that the power supply can use

last_power_output_watts = <sushy.resources.base.Field object>
    The average power output of this Power Supply

line_input_voltage = <sushy.resources.base.Field object>
    The line input voltage at which the Power Supply is operating

line_input_voltage_type = <sushy.resources.base.MappedField
object>
    The line voltage type supported as an input to this Power Supply

manufacturer = <sushy.resources.base.Field object>
    This is the manufacturer of this power supply

model = <sushy.resources.base.Field object>
    The model number for this Power Supply
```

```
name = <sushy.resources.base.Field object>
      Name of the Power Supply

part_number = <sushy.resources.base.Field object>
      The part number for this Power Supply

power_capacity_watts = <sushy.resources.base.Field object>
      The maximum capacity of this Power Supply

power_supply_type = <sushy.resources.base.MappedField object>
      The Power Supply type (AC or DC)

serial_number = <sushy.resources.base.Field object>
      The serial number for this Power Supply

spare_part_number = <sushy.resources.base.Field object>
      The spare part number for this Power Supply

status = <sushy.resources.common.StatusField object>
      Status of the sensor
```

## Module contents

### sushy.resources.chassis.thermal package

#### Submodules

##### sushy.resources.chassis.thermal.constants module

```
sushy.resources.chassis.thermal.constants.
FAN_READING_UNIT_PERCENTAGE =
'Percentage'
      Indicates that the fan reading and thresholds are measured in percentage

sushy.resources.chassis.thermal.constants.FAN_READING_UNIT_RPM =
'RPM'
      Indicates that the fan reading and thresholds are measured in rotations per minute.
```

##### sushy.resources.chassis.thermal.mappings module

##### sushy.resources.chassis.thermal.thermal module

```
class sushy.resources.chassis.thermal.thermal.FansListField(*args,
                                                       **kwargs)
Bases: sushy.resources.chassis.thermal.thermal.Sensor

The Fan device/s associated with Thermal.

indicator_led = <sushy.resources.base.MappedField object>
      The state of the indicator LED, used to identify the fan

manufacturer = <sushy.resources.base.Field object>
      This is the manufacturer of this Fan
```

```
max_reading_range = <sushy.resources.base.Field object>
    Maximum value for Reading

min_reading_range = <sushy.resources.base.Field object>
    Minimum value for Reading

model = <sushy.resources.base.Field object>
    The model of this Fan

part_number = <sushy.resources.base.Field object>
    Part number of this Fan

reading = <sushy.resources.base.Field object>
    Current Fan Speed

reading_units = <sushy.resources.base.MappedField object>
    Units in which the reading and thresholds are measured

serial_number = <sushy.resources.base.Field object>
    Serial number of this Fan

class sushy.resources.chassis.thermal.thermal.Sensor (*args, **kwargs)
Bases: sushy.resources.base.ListField

The sensor device/s associated with Thermal.

identity = <sushy.resources.base.Field object>
    Identifier of the Sensor

lower_threshold_critical = <sushy.resources.base.Field object>
    Below normal range but not yet fatal

lower_threshold_fatal = <sushy.resources.base.Field object>
    Below normal range and is fatal

lower_threshold_non_critical = <sushy.resources.base.Field
object>
    Below normal range

name = <sushy.resources.base.Field object>
    The name of this sensor

physical_context = <sushy.resources.base.Field object>
    Area or device associated with this sensor

status = <sushy.resources.common.StatusField object>
    Status of the sensor

upper_threshold_critical = <sushy.resources.base.Field object>
    Above normal range but not yet fatal

upper_threshold_fatal = <sushy.resources.base.Field object>
    Above normal range and is fatal

upper_threshold_non_critical = <sushy.resources.base.Field
object>
    Above normal range

class sushy.resources.chassis.thermal.thermal.TemperaturesListField (*args,
**kwargs)
Bases: sushy.resources.chassis.thermal.thermal.Sensor
```

The Temperature device/s associated with Thermal.

```
max_allowable_operating_value = <sushy.resources.base.Field object>
    Maximum allowable operating temperature for this equipment

max_reading_range_temp = <sushy.resources.base.Field object>
    Maximum value for ReadingCelsius

min_allowable_operating_value = <sushy.resources.base.Field object>
    Minimum allowable operating temperature for this equipment

min_reading_range_temp = <sushy.resources.base.Field object>
    Minimum value for ReadingCelsius

reading_celsius = <sushy.resources.base.Field object>
    Temperature

sensor_number = <sushy.resources.base.Field object>
    A numerical identifier to represent the temperature sensor

class sushy.resources.chassis.thermal.thermal.Thermal(connector, path='',

### Submodules

#### sushy.resources.chassis.chassis module

```
class sushy.resources.chassis.chassis.ActionsField(*args, **kwargs)
    Bases: sushy.resources.base.CompositeField
```

```
    reset = <sushy.resources.common.ResetActionField object>
```

```
class sushy.resources.chassis.chassis.Chassis(connector, identity,
                                               redfish_version=None,
                                               registries=None, root=None)
```

Bases: sushy.resources.base.ResourceBase

Chassis resource

The Chassis represents the physical components of a system. This resource represents the sheet-metal confined spaces and logical zones such as racks, enclosures, chassis and all other containers.

```
asset_tag = <sushy.resources.base.Field object>
```

The user assigned asset tag of this chassis

```
chassis_type = <sushy.resources.base.MappedField object>
```

The type of physical form factor of the chassis

```
depth_mm = <sushy.resources.base.Field object>
```

Depth in millimeters The depth of the chassis. The value of this property shall represent the depth (length) of the chassis (in millimeters) as specified by the manufacturer.

```
description = <sushy.resources.base.Field object>
```

The chassis description

```
get_allowed_reset_chassis_values()
```

Get the allowed values for resetting the chassis.

**Returns** A set of allowed values.

**Raises** MissingAttributeError, if Actions/#Chassis.Reset attribute not present.

```
height_mm = <sushy.resources.base.Field object>
```

Height in millimeters The height of the chassis. The value of this property shall represent the height of the chassis (in millimeters) as specified by the manufacturer.

```
identity = <sushy.resources.base.Field object>
```

Identifier for the chassis

```
indicator_led = <sushy.resources.base.MappedField object>
```

The state of the indicator LED, used to identify the chassis

```
property_managers
```

A list of managers for this chassis.

Returns a list of *Manager* objects representing the managers that manage this chassis.

**Raises** MissingAttributeError if ‘@odata.id’ field is missing.

**Returns** A list of *Manager* instances

**manufacturer** = <sushy.resources.base.Field object>

The manufacturer of this chassis

**model** = <sushy.resources.base.Field object>

The model number of the chassis

**name** = <sushy.resources.base.Field object>

The chassis name

**part\_number** = <sushy.resources.base.Field object>

The part number of the chassis

**physical\_security** =

<sushy.resources.chassis.chassis.PhysicalSecurity object>

PhysicalSecurity This value of this property shall contain the sensor state of the physical security.

**property power**

Property to reference *Power* instance

It is set once when the first time it is queried. On refresh, this property is marked as stale (greedy-refresh not done). Here the actual refresh of the sub-resource happens, if stale.

**power\_state** = <sushy.resources.base.MappedField object>

The current power state of the chassis

**reset\_chassis** (*value*)

Reset the chassis.

**Parameters** **value** – The target value.

**Raises** InvalidParameterValueError, if the target value is not allowed.

**serial\_number** = <sushy.resources.base.Field object>

The serial number of the chassis

**set\_indicator\_led** (*state*)

Set IndicatorLED to the given state.

**Parameters** **state** – Desired LED state, lit (INDICATOR\_LED\_LIT), blinking (INDICATOR\_LED\_BLINKING), off (INDICATOR\_LED\_OFF)

**Raises** InvalidParameterValueError, if any information passed is invalid.

**sku** = <sushy.resources.base.Field object>

Stock-keeping unit number (SKU) The value of this property shall be the stock-keeping unit number for this chassis.

**status** = <sushy.resources.common.StatusField object>

Status and Health This property describes the status and health of the chassis and its children.

**property systems**

A list of systems residing in this chassis.

Returns a list of *System* objects representing systems being mounted in this chassis/cabinet.

**Raises** MissingAttributeError if ‘@odata.id’ field is missing.

**Returns** A list of *System* instances

**property thermal**

Property to reference *Thermal* instance

It is set once when the first time it is queried. On refresh, this property is marked as stale (greedy-refresh not done). Here the actual refresh of the sub-resource happens, if stale.

**uuid = <sushy.resources.base.Field object>**

The Universal Unique Identifier (UUID) for this Chassis.

**weight\_kg = <sushy.resources.base.Field object>**

Weight in kilograms The value of this property shall represent the published mass (commonly referred to as weight) of the chassis (in kilograms).

**width\_mm = <sushy.resources.base.Field object>**

Width in millimeters The value of this property shall represent the width of the chassis (in millimeters) as specified by the manufacturer.

```
class sushy.resources.chassis.chassis.ChassisCollection(connector, path,
                                                       red-
                                                       fish_version=None,
                                                       registries=None,
                                                       root=None)
```

Bases: *sushy.resources.base.ResourceCollectionBase*

```
class sushy.resources.chassis.chassis.PhysicalSecurity(*args, **kwargs)
Bases: sushy.resources.base.CompositeField
```

**intrusion\_sensor = <sushy.resources.base.MappedField object>**

IntrusionSensor This indicates the known state of the physical security sensor, such as if it is hardware intrusion detected.

```
intrusion_sensor_number = <sushy.resources.base.Field object>
A numerical identifier to represent the physical security sensor
```

```
intrusion_sensor_re_arm = <sushy.resources.base.MappedField
object>
```

This indicates how the Normal state to be restored

## **sushy.resources.chassis.constants module**

```
sushy.resources.chassis.constants.
```

```
CHASSIS_INTRUSION_SENSOR_HARDWARE_INTRUSION = 'hardware intrusion
chassis intrusion sensor'
HardwareIntrusion
```

A door, lock, or other mechanism protecting the internal system hardware from being accessed is detected as being in an insecure state.

```
sushy.resources.chassis.constants.CHASSIS_INTRUSION_SENSOR_NORMAL =
'normal chassis intrusion sensor'
```

No abnormal physical security conditions are detected at this time

```
sushy.resources.chassis.constants.
```

```
CHASSIS_INTRUSION_SENSOR_RE_ARM_AUTOMATIC = 'automatic re arm chassis
intrusion sensor'
Automatic
```

This sensor would be restored to the Normal state automatically as no abnormal physical security conditions are detected.

sushy.resources.chassis.constants.

**CHASSIS\_INTRUSION\_SENSOR\_RE\_ARM\_MANUAL** = 'manual re arm chassis intrusion sensor'

This sensor would be restored to the Normal state by a manual re-arm

sushy.resources.chassis.constants.

**CHASSIS\_INTRUSION\_SENSOR\_TAMPERING\_DETECTED** = 'tampering detected chassis intrusion sensor'

Physical tampering of the monitored entity is detected

sushy.resources.chassis.constants.**CHASSIS\_TYPE\_BLADE** = 'blade chassis type'

Blade

An enclosed or semi-enclosed, typically vertically-oriented, system chassis which must be plugged into a multi-system chassis to function normally.

sushy.resources.chassis.constants.**CHASSIS\_TYPE\_CARD** = 'card chassis type'

Card

A loose device or circuit board intended to be installed in a system or other enclosure.

sushy.resources.chassis.constants.**CHASSIS\_TYPE\_CARTRIDGE** = 'cartridge chassis type'

Cartridge

A small self-contained system intended to be plugged into a multi-system chassis

sushy.resources.chassis.constants.**CHASSIS\_TYPE\_COMPONENT** = 'component chassis type'

Component

A small chassis, card, or device which contains devices for a particular subsystem or function.

sushy.resources.chassis.constants.**CHASSIS\_TYPE\_DRAWER** = 'drawer chassis type'

Drawer

An enclosed or semi-enclosed, typically horizontally-oriented, system chassis which may be slid into a multi-system chassis.

sushy.resources.chassis.constants.**CHASSIS\_TYPE\_ENCLOSURE** = 'enclosure chassis type'

A generic term for a chassis that does not fit any other description

sushy.resources.chassis.constants.**CHASSIS\_TYPE\_EXPANSION** = 'expansion chassis type'

A chassis which expands the capabilities or capacity of another chassis

sushy.resources.chassis.constants.**CHASSIS\_TYPE\_IP\_BASED\_DRIVE** = 'IP based drive chassis type'

A chassis in a drive form factor with IP-based network connections

sushy.resources.chassis.constants.**CHASSIS\_TYPE\_MODULE** = 'module chassis type'

Module

A small, typically removable, chassis or card which contains devices for a particular subsystem or function.

sushy.resources.chassis.constants.CHASSIS\_TYPE\_OTHER = 'other chassis type'

A chassis that does not fit any of these definitions

sushy.resources.chassis.constants.CHASSIS\_TYPE\_POD = 'pod chassis type'

Pod

A collection of equipment racks in a large, likely transportable, container

sushy.resources.chassis.constants.CHASSIS\_TYPE\_RACK = 'rack chassis type'

An equipment rack, typically a 19-inch wide freestanding unit

sushy.resources.chassis.constants.CHASSIS\_TYPE\_RACK\_GROUP = 'rack group chassis type'

A group of racks which form a single entity or share infrastructure

sushy.resources.chassis.constants.CHASSIS\_TYPE\_RACK\_MOUNT = 'rack mount chassis type'

RackMount

A single system chassis designed specifically for mounting in an equipment rack.

sushy.resources.chassis.constants.CHASSIS\_TYPE\_ROW = 'row chassis type'

A collection of equipment rack

sushy.resources.chassis.constants.CHASSIS\_TYPE\_SHELF = 'shelf chassis type'

Shelf

An enclosed or semi-enclosed, typically horizontally-oriented, system chassis which must be plugged into a multi-system chassis to function normally.

sushy.resources.chassis.constants.CHASSIS\_TYPE\_SIDECAR = 'sidecar chassis type'

Sidecar

A chassis that mates mechanically with another chassis to expand its capabilities or capacity.

sushy.resources.chassis.constants.CHASSIS\_TYPE\_SLED = 'sled chassis type'

Sled

An enclosed or semi-enclosed, system chassis which must be plugged into a multi-system chassis to function normally similar to a blade type chassis.

sushy.resources.chassis.constants.CHASSIS\_TYPE\_STAND\_ALONE = 'stand alone chassis type'

StandAlone

A single, free-standing system, commonly called a tower or desktop chassis.

sushy.resources.chassis.constants.CHASSIS\_TYPE\_STORAGE\_ENCLOSURE = 'storage enclosure chassis type'

A chassis which encloses storage

```
sushy.resources.chassis.constants.CHASSIS_TYPE_ZONE = 'zone chassis
type'
Zone
```

A logical division or portion of a physical chassis that contains multiple devices or systems that cannot be physically separated.

    Number of attempts an event posting is retried before the subscription is terminated. This retry  
    is at the service level, meaning the HTTP POST to the Event Destination was returned by the  
    HTTP operation as unsuccessful (4xx or 5xx return code) or an HTTP timeout occurred this  
    many times before the Event Destination subscription is terminated  
  
delivery_retry_interval = <sushy.resources.base.Field object>  
    Number of seconds between retry attempts for sending any given Event  
  
event_types_for_subscription = <sushy.resources.base.Field  
object>  
    Types of Events that can be subscribed to
```

**get\_event\_types\_for\_subscription()**

Get the Types of Events that can be subscribed to

**Returns** A set with the types of Events that can be subscribed to.

**identity = <sushy.resources.base.Field object>**

The EventService resource identity

**name = <sushy.resources.base.Field object>**

The EventService resource name

**service\_enabled = <sushy.resources.base.Field object>**

Indicates whether the EventService is enabled

**status = <sushy.resources.common.StatusField object>**

The status of the EventService

**submit\_test\_event (event\_id, event\_timestamp, event\_type, message, message\_args, message\_id, origin, severity)**

Submit Test Event is used to send a test event to the BMC

**Parameters**

- **event\_id** – ID of event to be added.
- **event\_timestamp** – time stamp of event to be added.
- **event\_type** – type of event to be added.
- **message** – human readable message of event to be added.
- **message\_args** – array of message arguments of the event to be added.
- **message\_id** – message ID of event to be added.
- **origin** – string of the URL within the OriginOfCondition property of the event to be added
- **severity** – the Severity of event to be added.
- **target** – The link to invoke action.

**Raises** MissingActionError if the EvenService does not have the action.

**property subscriptions**

Reference to a collection of Event Destination resources

## sushy.resources.eventservice.mappings module

                                               json_doc=None, root=None)
```

Bases: *sushy.resources.base.ResourceBase*

This class represents a fabric endpoint.

It represents the properties of an entity that sends or receives protocol defined messages over a transport.

```
IP_transport_details =  
<sushy.resources.fabric.endpoint.IPTransportDetailsListField  
object>
```

This array contains details for each IP transport supported by this endpoint. The array structure can be used to model multiple IP addresses for this endpoint.

```
connected_entities =  
<sushy.resources.fabric.endpoint.ConnectedEntitiesListField  
object>
```

All entities connected to this endpoint.

```
description = <sushy.resources.base.Field object>  
The endpoint description
```

```
endpoint_protocol = <sushy.resources.base.MappedField object>  
The protocol supported by this endpoint.
```

```
host_reservation_memory_bytes = <sushy.resources.base.Field  
object>
```

The amount of memory in Bytes that the Host should allocate to connect to this endpoint.

```
identity = <sushy.resources.base.Field object>  
Identifier for the endpoint
```

```
name = <sushy.resources.base.Field object>  
The endpoint name
```

```
pci_id = <sushy.resources.fabric.endpoint.PciIdField object>  
The PCI ID of the endpoint.
```

```
status = <sushy.resources.common.StatusField object>  
The endpoint status
```

```
class sushy.resources.fabric.endpoint.EndpointCollection(connector, path,  
red-  
fish_version=None,  
registries=None,  
root=None)
```

Bases: *sushy.resources.base.ResourceCollectionBase*

Represents a collection of endpoints associated with the fabric.

```
class sushy.resources.fabric.endpoint.IPTransportDetailsListField(*args,  
**kwargs)
```

Bases: *sushy.resources.base.ListField*

IP transport details

This array contains details for each IP transport supported by this endpoint. The array structure can be used to model multiple IP addresses for this endpoint.

```
ipv4_address = <sushy.resources.fabric.endpoint.IPv4AddressField  
object>
```

The IPv4 address object.

```
ipv6_address = <sushy.resources.fabric.endpoint.I Pv6AddressField object>
The IPv6 address object.

port = <sushy.resources.base.Field object>
The UDP or TCP port number used by the Endpoint.

transport_protocol = <sushy.resources.base.MappedField object>
The protocol used by the connection entity.

class sushy.resources.fabric.endpoint.I Pv4AddressField(*args, **kwargs)
Bases: sushy.resources.base.CompositeField

address = <sushy.resources.base.Field object>
This is the IPv4 Address.

address_origin = <sushy.resources.base.MappedField object>
This indicates how the address was determined.

gateway = <sushy.resources.base.Field object>
This is the IPv4 gateway for this address.

subnet_mask = <sushy.resources.base.Field object>
This is the IPv4 Subnet mask.

class sushy.resources.fabric.endpoint.I Pv6AddressField(*args, **kwargs)
Bases: sushy.resources.base.CompositeField

address = <sushy.resources.base.Field object>
This is the IPv6 Address.

address_origin = <sushy.resources.base.MappedField object>
This indicates how the address was determined.

address_state = <sushy.resources.base.MappedField object>
The current state of this address as defined in RFC 4862.

prefix_length = <sushy.resources.base.Field object>
This is the IPv6 Address Prefix Length.

class sushy.resources.fabric.endpoint.PciIdField(*args, **kwargs)
Bases: sushy.resources.base.CompositeField

device_id = <sushy.resources.base.Field object>
The Device ID of this PCIe function.

subsystem_id = <sushy.resources.base.Field object>
The Subsystem ID of this PCIe function.

subsystem_vendor_id = <sushy.resources.base.Field object>
The Subsystem Vendor ID of this PCIe function.

vendor_id = <sushy.resources.base.Field object>
The Vendor ID of this PCIe function.
```

## sushy.resources.fabric.fabric module

```
class sushy.resources.fabric.Fabric(connector, identity,
                                     redfish_version=None, registries=None,
                                     root=None)
```

Bases: *sushy.resources.base.ResourceBase*

Fabric resource

The Fabric represents a simple fabric consisting of one or more switches, zero or more endpoints, and zero or more zones.

**description** = <*sushy.resources.base.Field object*>

The fabric description

**property endpoints**

**fabric\_type** = <*sushy.resources.base.MappedField object*>

The protocol being sent over this fabric

**identity** = <*sushy.resources.base.Field object*>

Identifier for the fabric

**max\_zones** = <*sushy.resources.base.Field object*>

The maximum number of zones the switch can currently configure

**name** = <*sushy.resources.base.Field object*>

The fabric name

**status** = <*sushy.resources.common.StatusField object*>

The fabric status

```
class sushy.resources.fabric.FabricCollection(connector, path,
                                               redfish_version=None,
                                               registries=None,
                                               root=None)
```

Bases: *sushy.resources.base.ResourceCollectionBase*

## sushy.resources.fabric.mappings module

### Module contents

#### sushy.resources.manager package

##### Submodules

#### sushy.resources.manager.constants module

```
sushy.resources.manager.constants.COMMAND_SHELL_IPMI = 'command shell
ipmi'
```

Command Shell connection using the IPMI Serial-over-LAN (SOL) protocol

```
sushy.resources.manager.constants.COMMAND_SHELL_OEM = 'command shell
oem'
    Command Shell connection using an OEM-specific protocol
sushy.resources.manager.constants.COMMAND_SHELL_SSH = 'command shell
ssh'
    Command Shell connection using the SSH protocol
sushy.resources.manager.constants.COMMAND_SHELL_TELNET = 'command
shell telnet'
    Command Shell connection using the Telnet protocol
sushy.resources.manager.constants.GRAPHICAL_CONSOLE_KVMIP =
'graphical console kvmip'
    Graphical Console connection using a KVM-IP (redirection of Keyboard, Video, Mouse over IP)
protocol
sushy.resources.manager.constants.GRAPHICAL_CONSOLE_OEM = 'graphical
console oem'
    Graphical Console connection using an OEM-specific protocol
sushy.resources.manager.constants.MANAGER_TYPE_AUXILIARY_CONTROLLER =
'auxiliary controller'
    A controller which provides management functions for a particular subsystem or group of devices
sushy.resources.manager.constants.MANAGER_TYPE_BMC = 'bmc'
    A controller which provides management functions for a single computer system
sushy.resources.manager.constants.MANAGER_TYPE_ENCLOSURE_MANAGER =
'enclosure manager'
    A controller which provides management functions for a chassis or group of devices or systems
sushy.resources.manager.constants.MANAGER_TYPE_MANAGEMENT_CONTROLLER =
'management controller'
    A controller used primarily to monitor or manage the operation of a device or system
sushy.resources.manager.constants.MANAGER_TYPE_RACK_MANAGER = 'rack
manager'
    A controller which provides management functions for a whole or part of a rack
sushy.resources.manager.constants.RESET_MANAGER_FORCE_RESTART =
'force restart'
    Perform an immediate (non-graceful) shutdown, followed by a restart
sushy.resources.manager.constants.RESET_MANAGER_GRACEFUL_RESTART =
'graceful restart'
    Perform a graceful shutdown followed by a restart of the system
sushy.resources.manager.constants.SERIAL_CONSOLE_IPMI = 'serial
console ipmi'
    Serial Console connection using the IPMI Serial-over-LAN (SOL) protocol
sushy.resources.manager.constants.SERIAL_CONSOLE_OEM = 'serial
console oem'
    Serial Console connection using an OEM-specific protocol
sushy.resources.manager.constants.SERIAL_CONSOLE_SSH = 'serial
console ssh'
    Serial Console connection using the SSH protocol
```

```
sushy.resources.manager.constants.SERIAL_CONSOLE_TELNET = 'serial
console telnet'
    Serial Console connection using the Telnet protocol
```

## sushy.resources.manager.manager module

```
class sushy.resources.manager.ActionsField(*args, **kwargs)
    Bases: sushy.resources.base.CompositeField

    reset = <sushy.resources.common.ResetActionField object>

class sushy.resources.manager.Manager(connector, identity,
                                       redfish_version=None,
                                       registries=None, root=None)
    Bases: sushy.resources.base.ResourceBase

    auto_dst_enabled = <sushy.resources.base.Field object>
        Indicates whether the manager is configured for automatic DST adjustment

    property chassis
        A list of chassis managed by this manager.

        Returns a list of Chassis objects representing the chassis or cabinets managed by this manager.

        Raises MissingAttributeError if '@odata.id' field is missing.

        Returns A list of Chassis instances

    command_shell =
    <sushy.resources.manager.RemoteAccessField object>
        A dictionary containing the remote access support service via command shell (e.g. Telnet, SSH) and max concurrent sessions

    description = <sushy.resources.base.Field object>
        The manager description

    firmware_version = <sushy.resources.base.Field object>
        The manager firmware version

    get_allowed_reset_manager_values()
        Get the allowed values for resetting the manager.

        Returns A set of allowed values.

        Raises MissingAttributeError, if Actions/#Manager.Reset attribute not present.

    get_supported_command_shell_types()
        Get the supported values for Command Shell connection types.

        Returns A set of supported values.

    get_supported_graphical_console_types()
        Get the supported values for Graphical Console connection types.

        Returns A set of supported values.

    get_supported_serial_console_types()
        Get the supported values for Serial Console connection types.

        Returns A set of supported values.
```

```
graphical_console =
<sushy.resources.manager.manager.RemoteAccessField object>
    A dictionary containing the remote access support service via graphical console (e.g. KVMIP)
    and max concurrent sessions

identity = <sushy.resources.base.Field object>
    The manager identity string

manager_type = <sushy.resources.base.MappedField object>
    The manager type

model = <sushy.resources.base.Field object>
    The manager model

name = <sushy.resources.base.Field object>
    The manager name

reset_manager(value)
    Reset the manager.

    Parameters value – The target value.

    Raises InvalidParameterValueError, if the target value is not allowed.

serial_console =
<sushy.resources.manager.manager.RemoteAccessField object>
    A dictionary containing the remote access support service via serial console (e.g. Telnet, SSH,
    IPMI) and max concurrent sessions

property systems
    A list of systems managed by this manager.

    Returns a list of System objects representing systems being managed by this manager.

    Raises MissingAttributeError if ‘@odata.id’ field is missing.

    Returns A list of System instances

uuid = <sushy.resources.base.Field object>
    The manager UUID

property virtual_media

class sushy.resources.manager.manager.ManagerCollection(connector, path,
                                                       red-
                                                       fish_version=None,
                                                       registries=None,
                                                       root=None)
Bases: sushy.resources.base.ResourceCollectionBase

class sushy.resources.manager.manager.RemoteAccessField(*args, **kwargs)
Bases: sushy.resources.base.CompositeField

connect_types_supported = <sushy.resources.base.Field object>
max_concurrent_sessions = <sushy.resources.base.Field object>
service_enabled = <sushy.resources.base.Field object>
```

**sushy.resources.manager.mappings module****sushy.resources.manager.virtual\_media module**

```
class sushy.resources.manager.virtual_media.ActionsField(*args, **kwargs)
    Bases: sushy.resources.base.CompositeField

    eject_media = <sushy.resources.common.ActionField object>
    insert_media = <sushy.resources.common.ActionField object>

class sushy.resources.manager.virtual_media.VirtualMedia(connector,
    path='', red-
    fish_version=None,
    registries=None,
    reader=None,
    json_doc=None,
    root=None)
```

Bases: *sushy.resources.base.ResourceBase*

**connected\_via** = <*sushy.resources.base.MappedField* object>  
Current virtual media connection methods

Applet: Connected to a client application  
NotConnected: No current connection  
Oem: Connected via an OEM-defined method  
URI: Connected to a URI location

**eject\_media()**  
Detach remote media from virtual media

After ejecting media inserted will be False and image\_name will be empty.

**identity** = <*sushy.resources.base.Field* object>  
Virtual Media resource identity string

**image** = <*sushy.resources.base.Field* object>  
A URI providing the location of the selected image

**image\_name** = <*sushy.resources.base.Field* object>  
The image name

**insert\_media**(*image*, *inserted=True*, *write\_protected=True*, *username=None*,  
*password=None*)

Attach remote media to virtual media

**Parameters**

- **image** – a URI providing the location of the selected image
- **inserted** – specify if the image is to be treated as inserted upon completion of the action.
- **write\_protected** – indicates the media is write protected
- **username** – User name for the image URI.
- **password** – Password for the image URI.

**inserted** = <*sushy.resources.base.Field* object>

Indicates if virtual media is inserted in the virtual device

**is\_transfer\_protocol\_required** (*error=None*)

Check the response code and body and in case of failure

Try to determine if it happened due to missing TransferProtocolType.

**media\_types** = <*sushy.resources.base.Field object*>

List of supported media types as virtual media

**name** = <*sushy.resources.base.Field object*>

The name of resource

**write\_protected** = <*sushy.resources.base.Field object*>

Indicates the media is write protected

```
class sushy.resources.manager.virtual_media.VirtualMediaCollection(connector,
path,
red-
fish_version=None,
reg-
istries=None,
root=None)
```

Bases: *sushy.resources.base.ResourceCollectionBase*

A collection of virtual media attached to a Manager

## Module contents

### [sushy.resources.oem package](#)

#### Submodules

##### [sushy.resources.oem.base module](#)

```
class sushy.resources.oem.base.OEMResourceBase(connector, path=”,
redfish_version=None,
registries=None, reader=None,
root=None)
```

Bases: *sushy.resources.base.ResourceBase*

**set\_parent\_resource** (*parent\_resource, vendor\_id*)

##### [sushy.resources.oem.common module](#)

```
sushy.resources.oem.common.get_resource_extension_by_vendor(resource_name,
vendor,
resource)
```

Helper method to get Resource specific OEM extension object for vendor

#### Parameters

- **resource\_name** – The underscore joined name of the resource e.g. ‘system’ / ‘ethernet\_interface’ / ‘update\_service’

- **vendor** – This is the OEM vendor string which is the vendor-specific extensibility identifier. Examples are: ‘Contoso’, ‘Hpe’. As a matter of fact the lowercase of this string will be the plugin entry point name.
- **resource** – The Sushy resource instance

**Returns** The object returned by `plugin(*args, **kwds)` of extension.

**Raises** `OEMExtensionNotFoundError` – if no valid resource OEM extension found.

## sushy.resources.oem.fake module

```
class sushy.resources.oem.fake.ContosoActionsField(*args, **kwargs)
Bases: sushy.resources.base.CompositeField

reset = <sushy.resources.common.ResetActionField object>

class sushy.resources.oem.fake.FakeOEMSystemExtension(connector, path="",
                                                      redfish_version=None,
                                                      registries=None,
                                                      reader=None,
                                                      root=None)
Bases: sushy.resources.oem.base.OEMResourceBase

data_type = <sushy.resources.base.Field object>
get_reset_system_path()
name = <sushy.resources.base.Field object>
production_location =
<sushy.resources.oem.fake.ProductionLocationField object>

class sushy.resources.oem.fake.ProductionLocationField(*args, **kwargs)
Bases: sushy.resources.base.CompositeField

country = <sushy.resources.base.Field object>
facility_name = <sushy.resources.base.Field object>

sushy.resources.oem.get_extension(*args, **kwargs)
```

## Module contents

```
sushy.resources.oem.get_resource_extension_by_vendor(resource_name, vendor,
                                                     resource)
```

Helper method to get Resource specific OEM extension object for vendor

### Parameters

- **resource\_name** – The underscore joined name of the resource e.g. ‘system’ / ‘ethernet\_interface’ / ‘update\_service’
- **vendor** – This is the OEM vendor string which is the vendor-specific extensibility identifier. Examples are: ‘Contoso’, ‘Hpe’. As a matter of fact the lowercase of this string will be the plugin entry point name.

- **resource** – The Sushy resource instance

**Returns** The object returned by plugin(\*args, \*\*kwds) of extension.

**Raises** `OEMExtensionNotFoundError` – if no valid resource OEM extension found.

## sushy.resources.registry package

### Submodules

#### sushy.resources.registry.attribute\_registry module

```
class sushy.resources.registry.attribute_registry.AttributeListField(*args,
                                                               **kwargs)
Bases: sushy.resources.base.ListField

allowable_values = <sushy.resources.base.Field object>
    An array of the possible values for enumerated attribute values

attribute_type = <sushy.resources.base.Field object>
    The attribute type

default_value = <sushy.resources.base.Field object>
    The default value for the attribute

display_name = <sushy.resources.base.Field object>
    User-readable display string for attribute in the defined language

immutable = <sushy.resources.base.Field object>
    An indication of whether this attribute is immutable

lower_bound = <sushy.resources.base.Field object>
    The lower limit for an integer attribute

max_length = <sushy.resources.base.Field object>
    The maximum character length of the string attribute

min_length = <sushy.resources.base.Field object>
    The minimum character length of the string attribute

name = <sushy.resources.base.Field object>
    The unique name for the attribute

read_only = <sushy.resources.base.Field object>
    An indication of whether this attribute is read-only

reset_required = <sushy.resources.base.Field object>
    An indication of whether this attribute is read-only

unique = <sushy.resources.base.Field object>
    Indicates whether this attribute is unique for this system

upper_bound = <sushy.resources.base.Field object>
    The upper limit for an integer attribute
```

```
class sushy.resources.registry.attribute_registry.AttributeRegistry(connector,
    path='',
    red-
    fish_version=None,
    reg-
    istries=None,
    reader=None,
    json_doc=None,
    root=None)

Bases: sushy.resources.base.ResourceBase

description = <sushy.resources.base.Field object>
    Human-readable description of the registry

identity = <sushy.resources.base.Field object>
    The Attribute registry identity string

language = <sushy.resources.base.Field object>
    RFC 5646 compliant language code for the registry

name = <sushy.resources.base.Field object>
    The name of the attribute registry

owning_entity = <sushy.resources.base.Field object>
    Organization or company that publishes this registry

registry_entries = <sushy.resources.registry.attribute_registry.
AttributeRegistryEntryField
object>
    Field containing Attributes, Dependencies, Menus etc.

registry_version = <sushy.resources.base.Field object>
    The version of this registry

supported_systems = <sushy.resources.base.Field object>
    The system that this registry supports

class sushy.resources.registry.attribute_registry.AttributeRegistryEntryField(*an
    **
```

Bases: *sushy.resources.base.CompositeField*

```
attributes =
<sushy.resources.registry.attribute_registry.AttributeListField
object>
    List of attributes in this registry
```

## **sushy.resources.registry.message\_registry module**

```
class sushy.resources.registry.message_registry.MessageDictionaryField(*args,
    **kwargs)

Bases: sushy.resources.base.DictionaryField

description = <sushy.resources.base.Field object>
    Indicates how and when the message is returned by the Redfish service
```

```
message = <sushy.resources.base.Field object>
    Template text of the message

    Template can include placeholders for message arguments in form %<integer> where <integer>
    denotes a position passed from MessageArgs.

number_of_args = <sushy.resources.base.Field object>
    Number of arguments to be expected to be passed in as MessageArgs for this message

param_types = <sushy.resources.base.Field object>
    Mapped MessageArg types, in order, for the message

resolution = <sushy.resources.base.Field object>
    Suggestions on how to resolve the situation that caused the error

severity = <sushy.resources.base.MappedField object>
    Mapped severity of the message

class sushy.resources.registry.message_registry.MessageRegistry(connector,
    path="",
    red-
    fish_version=None,
    reg-
    istry=None,
    reader=None,
    json_doc=None,
    root=None)

Bases: sushy.resources.base.ResourceBase

description = <sushy.resources.base.Field object>
    Human-readable description of the message registry

identity = <sushy.resources.base.Field object>
    The Message registry identity string

language = <sushy.resources.base.Field object>
    RFC 5646 compliant language code for the registry

messages = <sushy.resources.registry.message_registry.
    MessageDictionaryField
    object>
    List of messages in this registry

name = <sushy.resources.base.Field object>
    The name of the message registry

owning_entity = <sushy.resources.base.Field object>
    Organization or company that publishes this registry

registry_prefix = <sushy.resources.base.Field object>
    Prefix used in messageIDs which uniquely identifies all of the messages in this registry as be-
    longing to this registry

registry_version = <sushy.resources.base.Field object>
    Message registry version which is used in the middle portion of a messageID

sushy.resources.registry.message_registry.parse_message(message_registries,
    message_field)
    Parse the messages in registries and substitute any parms
```

Check only registries that support messages.

#### Parameters

- **registries** – dict of Message Registries
- **message\_field** – settings.MessageListField to parse

**Returns** parsed settings.MessageListField with missing attributes filled

## sushy.resources.registry.message\_registry\_file module

```
class sushy.resources.registry.message_registry_file.LocationListField(*args,  
**kwargs)
```

Bases: *sushy.resources.base.ListField*

Location for each registry file of languages supported

There are 3 options where the file can be hosted:

- locally as a single file,
- locally as a part of archive (zip or other),
- publicly on the Internet.

```
archive_file = <sushy.resources.base.Field object>  
File name for registry if using archive_uri
```

```
archive_uri = <sushy.resources.base.Field object>  
Location URI for archive file
```

```
language = <sushy.resources.base.Field object>  
File's RFC5646 language code or the string 'default'
```

```
publication_uri = <sushy.resources.base.Field object>  
Location URI of publicly available schema
```

```
uri = <sushy.resources.base.Field object>  
Location URI for co-located registry file with the Redfish service
```

```
class sushy.resources.registry.message_registry_file.MessageRegistryFile(connector,  
path='',  
red-  
fish_verio  
reg-  
istries=None  
reader=None  
json_doc=  
root=None)
```

Bases: *sushy.resources.base.ResourceBase*

```
description = <sushy.resources.base.Field object>  
Description of Message Registry file resource
```

```
get_attribute_registry(language, public_connector)  
Get an Attribute Registry from the location
```

#### Parameters

- **language** – RFC 5646 language code for registry files
- **public\_connector** – connector to use when downloading registry from the Internet

**Returns** an AttributeRegistry or None if not found

**get\_message\_registry** (*language, public\_connector*)

Get a Message Registry from the location

#### Parameters

- **language** – RFC 5646 language code for registry files
- **public\_connector** – connector to use when downloading registry from the Internet

**Returns** a MessageRegistry or None if not found

**identity** = `<sushy.resources.base.Field object>`

Identity of Message Registry file resource

**languages** = `<sushy.resources.base.Field object>`

List of RFC 5646 language codes supported by this resource

**location** = `<sushy.resources.registry.message_registry_file.LocationListField object>`

List of locations of Registry files for each supported language

**name** = `<sushy.resources.base.Field object>`

Name of Message Registry file resource

**registry** = `<sushy.resources.base.Field object>`

Prefix for MessageId used for messages from this resource

This attribute is in form Registry\_name.Major\_version.Minor\_version

**class** `sushy.resources.registry.message_registry_file.MessageRegistryFileCollection`

Bases: `sushy.resources.base.ResourceCollectionBase`

Collection of Message Registry Files

**class** `sushy.resources.registry.message_registry_file.RegistryType` (*connector, path=*, *red-*, *fish\_version=None,* *reg-*, *istries=None,* *reader=None,* *json\_doc=None,* *root=None*)

Bases: `sushy.resources.base.ResourceBase`

## Module contents

### sushy.resources.sessionservice package

#### Submodules

##### sushy.resources.sessionservice.session module

```
class sushy.resources.sessionservice.session.Session(connector, identity,
redfish_version=None,
registries=None,
root=None)
```

Bases: *sushy.resources.base.ResourceBase*

**delete()**

Method for deleting a Session.

**Raises** ServerSideError

**description = <sushy.resources.base.Field object>**

The session service description

**identity = <sushy.resources.base.Field object>**

The session service identify string

**name = <sushy.resources.base.Field object>**

The session service name

**username = <sushy.resources.base.Field object>**

The UserName for the account for this session.

```
class sushy.resources.sessionservice.session.SessionCollection(connector,
identity,
red-
fish_version=None,
reg-
istries=None,
root=None)
```

Bases: *sushy.resources.base.ResourceCollectionBase*

**description = <sushy.resources.base.Field object>**

The session collection description

**name = <sushy.resources.base.Field object>**

The session collection name

## sushy.resources.sessionservice.sessionservice module

```
class sushy.resources.sessionservice.sessionservice.SessionService(connector,
    identity,
    red-
    fish_version=None,
    reg-
    istries=None,
    root=None)
```

Bases: `sushy.resources.base.ResourceBase`

**close\_session**(*session\_uri*)

This function is for closing a session based on its id.

**Raises** ServerSideError

**create\_session**(*username*, *password*, *target\_uri*=None)

This function will try to create a session.

Create a session and return the associated key and URI.

### Parameters

- **username** – the username of the user requesting a new session
- **password** – the password associated to the user requesting a new session
- **target\_uri** – the “Sessions” uri, usually in the form: ‘/red-fish/v1/SessionService/Sessions’

**Returns** A session key and uri in the form of a tuple

**Raises** MissingXAuthToken

**Raises** ConnectionError

**Raises** AccessError

**Raises** HTTPError

**description** = <`sushy.resources.base.Field` object>

The session service description

**identity** = <`sushy.resources.base.Field` object>

The session service identify string

**name** = <`sushy.resources.base.Field` object>

The session service name

**service\_enabled** = <`sushy.resources.base.Field` object>

Tells us if session service is enabled

**session\_timeout** = <`sushy.resources.base.Field` object>

The session service timeout

**property sessions**

Property to provide reference to the *SessionCollection* instance

It is calculated once when the first time it is queried. On refresh, this property gets reset.

## Module contents

### sushy.resources.system package

#### Subpackages

##### sushy.resources.system.storage package

#### Submodules

##### sushy.resources.system.storage.constants module

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID0 = 'RAID0'
```

A placement policy where consecutive logical blocks of data are uniformly distributed across a set of independent storage devices without offering any form of redundancy.

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID00 = 'RAID00'
```

A placement policy that creates a RAID 0 stripe set over two or more RAID 0 sets.

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID01 = 'RAID01'
```

A data placement policy that creates a mirrored device (RAID 1) over a set of striped devices (RAID 0).

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID1 = 'RAID1'
```

A placement policy where each logical block of data is stored on more than one independent storage device.

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID10 = 'RAID10'
```

A placement policy that creates a striped device (RAID 0) over a set of mirrored devices (RAID 1).

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID10E = 'RAID10E'
```

A placement policy that uses a RAID 0 stripe set over two or more RAID 10 sets.

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID10Triple = 'RAID10Triple'
```

A placement policy that uses a striped device (RAID 0) over a set of triple mirrored devices (RAID 1Triple).

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID1E = 'RAID1E'
```

A placement policy that uses a form of mirroring implemented over a set of independent storage devices where logical blocks are duplicated on a pair of independent storage devices so that data is uniformly distributed across the storage devices.

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID1Triple = 'RAID1Triple'
```

A placement policy where each logical block of data is mirrored three times across a set of three independent storage devices.

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID3 = 'RAID3'
```

A placement policy using parity-based protection where logical bytes of data are uniformly distributed across a set of independent storage devices and where the parity is stored on a dedicated independent storage device.

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID4 = 'RAID4'
```

A placement policy using parity-based protection where logical blocks of data are uniformly distributed across a set of independent storage devices and where the parity is stored on a dedicated independent storage device.

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID5 = 'RAID5'
```

A placement policy using parity-based protection for storing stripes of ‘n’ logical blocks of data and one logical block of parity across a set of ‘n+1’ independent storage devices where the parity and data blocks are interleaved across the storage devices.

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID50 = 'RAID50'
```

A placement policy that uses a RAID 0 stripe set over two or more RAID 5 sets of independent storage devices.

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID6 = 'RAID6'
```

A placement policy using parity-based protection for storing stripes of ‘n’ logical blocks of data and two logical blocks of independent parity across a set of ‘n+2’ independent storage devices where the parity and data blocks are interleaved across the storage devices.

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID60 = 'RAID60'
```

A placement policy that uses a RAID 0 stripe set over two or more RAID 6 sets of independent storage devices.

```
sushy.resources.system.storage.constants.RAID_TYPE_RAID6TP =  
'RAID6TP'
```

A placement policy that uses parity-based protection for storing stripes of ‘n’ logical blocks of data and three logical blocks of independent parity across a set of ‘n+3’ independent storage devices where the parity and data blocks are interleaved across the storage devices.

```
sushy.resources.system.storage.constants.VOLUME_INIT_TYPE_FAST =  
'fast'
```

The volume is prepared for use quickly, typically by erasing just the beginning and end of the space so that partitioning can be performed.

```
sushy.resources.system.storage.constants.VOLUME_INIT_TYPE_SLOW =  
'slow'
```

The volume is prepared for use slowly, typically by completely erasing the volume.

```
sushy.resources.system.storage.constants.VOLUME_TYPE_MIRRORED =  
'mirrored'
```

The volume is a mirrored device.

```
sushy.resources.system.storage.constants.VOLUME_TYPE_NON_REDUNDANT =  
'nonredundant'
```

The volume is a non-redundant storage device.

```
sushy.resources.system.storage.constants.VOLUME_TYPE_RAW_DEVICE =  
'rawdevice'
```

The volume is a raw physical device without any RAID or other virtualization applied.

```
sushy.resources.system.storage.constants.VOLUME_TYPE_SPANNED_MIRRORS =  
'spannedmirrors'
```

The volume is a spanned set of mirrored devices.

```
sushy.resources.system.storage.constants.  
VOLUME_TYPE_SPANNED_STRIPESP_WITH_PARITY =  
'spannedstripeswithparity'
```

The volume is a spanned set of devices which uses parity to retain redundant information.

```
sushy.resources.system.storage.constants.
```

```
VOLUME_TYPE_STRIPED_WITH_PARITY =
'stripedwithparity'
```

The volume is a device which uses parity to retain redundant information.

## sushy.resources.system.storage.drive module

```
class sushy.resources.system.storage.Drive(connector, path="",
                                             redfish_version=None,
                                             registries=None,
                                             reader=None,
                                             json_doc=None, root=None)
```

Bases: *sushy.resources.base.ResourceBase*

This class represents a disk drive or other physical storage medium.

**block\_size\_bytes** = <sushy.resources.base.Field object>

The size of the smallest addressable unit of this drive in bytes

**capacity\_bytes** = <sushy.resources.base.Field object>

The size in bytes of this Drive

**identifiers** = <sushy.resources.common.IdentifiersListField
object>

The Durable names for the drive

**identity** = <sushy.resources.base.Field object>

The Drive identity string

**indicator\_led** = <sushy.resources.base.MappedField object>

Whether the indicator LED is lit or off

**manufacturer** = <sushy.resources.base.Field object>

This is the manufacturer of this drive

**media\_type** = <sushy.resources.base.Field object>

The type of media contained in this drive

**model** = <sushy.resources.base.Field object>

This is the model number for the drive

**name** = <sushy.resources.base.Field object>

The name of the resource

**part\_number** = <sushy.resources.base.Field object>

The part number for this drive

**protocol** = <sushy.resources.base.MappedField object>

Protocol this drive is using to communicate to the storage controller

**serial\_number** = <sushy.resources.base.Field object>

The serial number for this drive

**set\_indicator\_led**(state)

Set IndicatorLED to the given state.

**Parameters** **state** – Desired LED state, lit (INDICATOR\_LED\_LIT), blinking (INDICATOR\_LED\_BLINKING), off (INDICATOR\_LED\_OFF)

**Raises** `InvalidParameterValueError`, if any information passed is invalid.

**status = <sushy.resources.common.StatusField object>**

This type describes the status and health of the drive

**property volumes**

A list of volumes that this drive is part of.

Volumes that this drive either wholly or only partially contains.

**Raises** `MissingAttributeError` if ‘@odata.id’ field is missing.

**Returns** A list of *Volume* instances

## [sushy.resources.system.storage.mappings module](#)

### [sushy.resources.system.storage.storage module](#)

```
class sushy.resources.system.storage.storage.Storage(connector, path='',  
    redfish_version=None,  
    registries=None,  
    reader=None,  
    json_doc=None,  
    root=None)
```

Bases: [sushy.resources.base.ResourceBase](#)

This class represents the storage subsystem resources.

A storage subsystem represents a set of storage controllers (physical or virtual) and the resources such as drives and volumes that can be accessed from that subsystem.

**property drives**

Return a list of *Drive* objects present in the storage resource.

It is set once when the first time it is queried. On subsequent invocations, it returns a cached list of *Drives* objects until it is marked stale.

**Returns** A list of *Drive* objects

**Raises** `ResourceNotFoundError`

**drives\_identities = <sushy.resources.base.Field object>**

A tuple with the drive identities

**property drives\_max\_size\_bytes**

Max size available in bytes among all Drives of this collection.

**property drives\_sizes\_bytes**

Sizes of all Drives in bytes in Storage resource.

Returns the list of cached values until it (or its parent resource) is refreshed.

**get\_drive(drive\_identity)**

Given the drive identity return a *Drive* object

**Parameters** `drive_identity` – The identity of the *Drive*

**Returns** The *Drive* object

**Raises** ResourceNotFoundError

**identity** = <sushy.resources.base.Field object>  
The Storage identity string

**name** = <sushy.resources.base.Field object>  
The name of the resource

**status** = <sushy.resources.common.StatusField object>  
Describes the status and health of the resource and its children.

**storage\_controllers** = <sushy.resources.system.storage.storage.StorageControllersListField object>  
The storage devices associated with this resource.

**property volumes**  
Property to reference *VolumeCollection* instance

It is set once when the first time it is queried. On refresh, this property is marked as stale (greedy-refresh not done at that point). Here only the actual refresh of the sub-resource happens, if resource is stale.

**class** sushy.resources.system.storage.storage.StorageCollection(*connector*,  
*path*,  
*red-*  
*fish\_version=None*,  
*reg-*  
*istries=None*,  
*root=None*)

Bases: *sushy.resources.base.ResourceCollectionBase*

This class represents the collection of Storage resources

**property drives\_sizes\_bytes**  
Sizes of each Drive in bytes in Storage collection resource.

Returns the list of cached values until it (or its parent resource) is refreshed.

**property max\_drive\_size\_bytes**  
Max size available (in bytes) among all Drive resources.

Returns the cached value until it (or its parent resource) is refreshed.

**property max\_volume\_size\_bytes**  
Max size available (in bytes) among all Volume resources.

Returns the cached value until it (or its parent resource) is refreshed.

**property volumes\_sizes\_bytes**  
Sizes of each Volume in bytes in Storage collection resource.

Returns the list of cached values until it (or its parent resource) is refreshed.

**class** sushy.resources.system.storage.storage.StorageControllersListField(\*args,  
\*\*kwargs)

Bases: *sushy.resources.base.ListField*

The set of storage controllers represented by this resource.

```
controller_protocols = <sushy.resources.base.MappedListField object>
The protocols by which this storage controller can be communicated to

device_protocols = <sushy.resources.base.MappedListField object>
The protocols which the controller can use to communicate with devices

identifiers = <sushy.resources.common.IdentifiersListField object>
The Durable names for the storage controller.

member_id = <sushy.resources.base.Field object>
Uniquely identifies the member within the collection.

name = <sushy.resources.base.Field object>
The name of the storage controller

raid_types = <sushy.resources.base.MappedListField object>
The set of RAID types supported by the storage controller.

speed_gbps = <sushy.resources.base.Field object>
The maximum speed of the storage controller's device interface.

status = <sushy.resources.common.StatusField object>
Describes the status and health of the resource and its children.
```

## sushy.resources.system.storage.volume module

```
class sushy.resources.system.storage.volume.ActionsField(*args, **kwargs)
Bases: sushy.resources.base.CompositeField

initialize = <sushy.resources.common.InitializeActionField object>

class sushy.resources.system.storage.volume.Volume(connector, path='',
                                                    redfish_version=None,
                                                    registries=None,
                                                    reader=None,
                                                    json_doc=None,
                                                    root=None)
```

Bases: sushy.resources.base.ResourceBase

This class adds the Storage Volume resource

```
block_size_bytes = <sushy.resources.base.Field object>
The size of the smallest addressable unit of this volume in bytes.

capacity_bytes = <sushy.resources.base.Field object>
The size in bytes of this Volume.

delete(payload=None, apply_time=None, timeout=500)
Delete the volume.
```

### Parameters

- **payload** – May contain @Redfish.OperationApplyTime property

- **apply\_time** – When to update the attributes. Optional. APPLY\_TIME\_IMMEDIATE - Immediate, APPLY\_TIME\_ON\_RESET - On reset, APPLY\_TIME\_MAINT\_START - During specified maintenance time  
APPLY\_TIME\_MAINT\_RESET - On reset during specified maintenance time
- **timeout** – Max time in seconds to wait for blocking async call.

**Raises** ConnectionError

**Raises** HTTPError

**Returns** TaskMonitor if async task or None if successful deletion

**delete\_volume** (*payload=None*, *apply\_time=None*, *timeout=500*)

Delete the volume.

Deprecated: Use delete

#### Parameters

- **payload** – May contain @Redfish.OperationApplyTime property
- **apply\_time** – When to update the attributes. Optional. APPLY\_TIME\_IMMEDIATE - Immediate, APPLY\_TIME\_ON\_RESET - On reset, APPLY\_TIME\_MAINT\_START - During specified maintenance time  
APPLY\_TIME\_MAINT\_RESET - On reset during specified maintenance time
- **timeout** – Max time in seconds to wait for blocking async call.

**Raises** ConnectionError

**Raises** HTTPError

**Returns** TaskMonitor if async task or None if successful deletion

**encrypted** = <sushy.resources.base.Field object>

Is this Volume encrypted.

**get\_allowed\_initialize\_volume\_values()**

Get the allowed values for initializing the volume.

**Returns** A set with the allowed values.

**identifiers** = <sushy.resources.common.IdentifiersListField object>

The Durable names for the volume.

**identity** = <sushy.resources.base.Field object>

The Volume identity string

**initialize** (*value='fast'*, *apply\_time=None*, *timeout=500*)

Initialize the volume.

#### Parameters

- **value** – The InitializeType value.
- **apply\_time** – When to update the attributes. Optional. APPLY\_TIME\_IMMEDIATE - Immediate, APPLY\_TIME\_ON\_RESET - On reset, APPLY\_TIME\_MAINT\_START - During specified maintenance time

APPLY\_TIME\_MAINT\_RESET - On reset during specified maintenance time

- **timeout** – Max time in seconds to wait for blocking async call.

**Raises** InvalidParameterValueError, if the target value is not allowed.

**Raises** ConnectionError

**Raises** HTTPError

**Returns** TaskMonitor if async task or None if successful init

**initialize\_volume** (*value='fast'*, *apply\_time=None*, *timeout=500*)

Initialize the volume.

Deprecated: Use initialize

#### Parameters

- **value** – The InitializeType value.
- **apply\_time** – When to update the attributes. Optional. APPLY\_TIME\_IMMEDIATE - Immediate, APPLY\_TIME\_ON\_RESET - On reset, APPLY\_TIME\_MAINT\_START - During specified maintenance time  
APPLY\_TIME\_MAINT\_RESET - On reset during specified maintenance time
- **timeout** – Max time in seconds to wait for blocking async call.

**Raises** InvalidParameterValueError, if the target value is not allowed.

**Raises** ConnectionError

**Raises** HTTPError

**Returns** TaskMonitor if async task or None if successful init

**name** = <sushy.resources.base.Field object>

The name of the resource

**operation\_apply\_time\_support** =

<sushy.resources.common.OperationApplyTimeSupportField object>

Indicates if a client is allowed to request for a specific apply time of a create, delete, or action operation of a given resource

**raid\_type** = <sushy.resources.base.MappedField object>

The RAID type of this volume.

**volume\_type** = <sushy.resources.base.MappedField object>

The type of this volume.

**class** sushy.resources.system.storage.volume.**VolumeCollection** (*connector*,  
*path*, *red-*  
*fish\_version=None*,  
*reg-*  
*istries=None*,  
*root=None*)

Bases: *sushy.resources.base.ResourceCollectionBase*

This class represents the Storage Volume collection

**create** (*payload*, *apply\_time=None*, *timeout=500*)

Create a volume.

**Parameters**

- **payload** – The payload representing the new volume to create.
- **apply\_time** – When to update the attributes. Optional. APPLY\_TIME\_IMMEDIATE - Immediate, APPLY\_TIME\_ON\_RESET - On reset, APPLY\_TIME\_MAINT\_START - During specified maintenance time APPLY\_TIME\_MAINT\_RESET - On reset during specified maintenance time
- **timeout** – Max time in seconds to wait for blocking async call.

**Raises** ConnectionError

**Raises** HTTPError

**Returns** Newly created Volume resource or TaskMonitor if async task

**create\_volume** (*payload*, *apply\_time=None*, *timeout=500*)

Create a volume.

Deprecated: Use create.

**Parameters**

- **payload** – The payload representing the new volume to create.
- **apply\_time** – When to update the attributes. Optional. APPLY\_TIME\_IMMEDIATE - Immediate, APPLY\_TIME\_ON\_RESET - On reset, APPLY\_TIME\_MAINT\_START - During specified maintenance time APPLY\_TIME\_MAINT\_RESET - On reset during specified maintenance time
- **timeout** – Max time in seconds to wait for blocking async call.

**Raises** ConnectionError

**Raises** HTTPError

**Returns** Newly created Volume resource or TaskMonitor if async task

**property max\_size\_bytes**

Max size available (in bytes) among all Volume resources.

Returns the cached value until it (or its parent resource) is refreshed.

**property max\_volume\_size\_bytes**

Max size available (in bytes) among all Volume resources.

Returns the cached value until it (or its parent resource) is refreshed.

**operation\_apply\_time\_support =****<sushy.resources.common.OperationApplyTimeSupportField object>**

Indicates if a client is allowed to request for a specific apply time of a create, delete, or action operation of a given resource

**property volumes\_sizes\_bytes**

Sizes of all Volumes in bytes in VolumeCollection resource.

Returns the list of cached values until it (or its parent resource) is refreshed.

## Module contents

### Submodules

#### sushy.resources.system.bios module

```
class sushy.resources.system.bios.ActionsField(*args, **kwargs)
    Bases: sushy.resources.base.CompositeField

    change_password = <sushy.resources.common.ActionField object>
    reset_bios = <sushy.resources.common.ActionField object>

class sushy.resources.system.bios.Bios(connector, path, redfish_version=None,
                                         registries=None, root=None)
    Bases: sushy.resources.base.ResourceBase

    property apply_time_settings

    attributes = <sushy.resources.base.Field object>
        Vendor-specific key-value dict of effective BIOS attributes

        Attributes cannot be updated directly. To update use set_attribute() or
        set_attributes()

    change_password(new_password, old_password, password_name)
        Change BIOS password

    description = <sushy.resources.base.Field object>
        Human-readable description of the BIOS resource

    get_attribute_registry(language='en')
        Get the Attribute Registry associated with this BIOS instance

        Parameters language – RFC 5646 language code for Message Registries. Indicates language of registry to be used. Defaults to ‘en’.

        Returns the BIOS Attribute Registry

    identity = <sushy.resources.base.Field object>
        The Bios resource identity string

    maintenance_window =
        <sushy.resources.settings.MaintenanceWindowField object>
        Indicates if a given resource has a maintenance window assignment for applying settings or
        operations

    name = <sushy.resources.base.Field object>
        The name of the resource

    property pending_attributes
        Pending BIOS attributes

        BIOS attributes that have been committed to the system, but for them to take effect system
        restart is necessary

    reset_bios()
        Reset the BIOS attributes to default
```

```
set_attribute (key, value, apply_time=None, maint_window_start_time=None,
               maint_window_duration=None)
```

Update an attribute

Attribute update is not immediate but requires system restart. Committed attributes can be checked at [pending\\_attributes](#) property

#### Parameters

- **key** – Attribute name
- **value** – Attribute value
- **apply\_time** – When to update the attribute. Optional. APPLY\_TIME\_IMMEDIATE - Immediate, APPLY\_TIME\_ON\_RESET - On reset, APPLY\_TIME\_MAINT\_START - During specified maintenance time APPLY\_TIME\_MAINT\_RESET - On reset during specified maintenance time
- **maint\_window\_start\_time** – The start time of a maintenance window, datetime. Required when updating during maintenance window and default maintenance window not set by the system.
- **maint\_window\_duration** – Duration of maintenance time since maintenance window start time in seconds. Required when updating during maintenance window and default maintenance window not set by the system.

```
set_attributes (value, apply_time=None, maint_window_start_time=None,
                maint_window_duration=None)
```

Update many attributes at once

Attribute update is not immediate but requires system restart. Committed attributes can be checked at [pending\\_attributes](#) property

#### Parameters

- **value** – Key-value pairs for attribute name and value
- **apply\_time** – When to update the attributes. Optional. APPLY\_TIME\_IMMEDIATE - Immediate, APPLY\_TIME\_ON\_RESET - On reset, APPLY\_TIME\_MAINT\_START - During specified maintenance time APPLY\_TIME\_MAINT\_RESET - On reset during specified maintenance time
- **maint\_window\_start\_time** – The start time of a maintenance window, datetime. Required when updating during maintenance window and default maintenance window not set by the system.
- **maint\_window\_duration** – Duration of maintenance time since maintenance window start time in seconds. Required when updating during maintenance window and default maintenance window not set by the system.

#### property supported\_apply\_times

List of supported BIOS update apply times

**Returns** List of supported update apply time names

#### property update\_status

Status of the last attribute update

**Returns** `sushy.resources.settings.SettingsUpdate` object containing status and any messages

### **sushy.resources.system.constants module**

```
sushy.resources.system.constants.BOOT_SOURCE_TARGET_BIOS_SETUP =  
'bios setup'  
    Boot to the BIOS Setup Utility  
  
sushy.resources.system.constants.BOOT_SOURCE_TARGET_CD = 'cd'  
    Boot from the CD/DVD disc  
  
sushy.resources.system.constants.BOOT_SOURCE_TARGET_DIAGS = 'diags'  
    Boot the manufacturer's Diagnostics program  
  
sushy.resources.system.constants.BOOT_SOURCE_TARGET_FLOPPY = 'floppy'  
    Boot from the floppy disk drive  
  
sushy.resources.system.constants.BOOT_SOURCE_TARGET_HDD = 'hdd'  
    Boot from a hard drive  
  
sushy.resources.system.constants.BOOT_SOURCE_TARGET_NONE = 'none'  
    Boot from the normal boot device  
  
sushy.resources.system.constants.BOOT_SOURCE_TARGET_PXE = 'pxe'  
    Boot from the Pre-Boot EXecution (PXE) environment  
  
sushy.resources.system.constants.BOOT_SOURCE_TARGET_SD_CARD = 'sd  
card'  
    Boot from an SD Card  
  
sushy.resources.system.constants.BOOT_SOURCE_TARGET_UEFI_HTTP = 'uefi  
http'  
    Boot from a UEFI HTTP network location  
  
sushy.resources.system.constants.BOOT_SOURCE_TARGET_UEFI_SHELL =  
'uefi shell'  
    Boot to the UEFI Shell  
  
sushy.resources.system.constants.BOOT_SOURCE_TARGET_UEFI_TARGET =  
'uefi target'  
    Boot to the UEFI Device specified in the UefiTargetBootSourceOverride property  
  
sushy.resources.system.constants.BOOT_SOURCE_TARGET_USB = 'usb'  
    Boot from a USB device as specified by the system BIOS  
  
sushy.resources.system.constants.BOOT_SOURCE_TARGET_USB_CD = 'usb cd'  
    Boot from a USB CD device as specified by the system BIOS. NOTE(janders): This is NOT a standard value. On SuperMicro X11 and X12 machines, virtual media is presented as an USB CD drive as opposed to a CD drive. Both are present in the list of boot devices, however only selecting UsbCd as the boot source results in a successful boot from vMedia. If CD is selected, boot fails even if vMedia is inserted.  
  
sushy.resources.system.constants.BOOT_SOURCE_TARGET_UTILITIES =  
'utilities'  
    Boot the manufacturer's Utilities program(s)
```

```
sushy.resources.system.constants.SECURE_BOOT_DISABLED = 'Disabled'
    UEFI secure boot is disabled.

sushy.resources.system.constants.SECURE_BOOT_ENABLED = 'Enabled'
    UEFI secure boot is enabled.

sushy.resources.system.constants.SYSTEM_INDICATOR_LED_BLINKING =
'indicator led blinking'
    The Indicator LED is blinking

    Deprecated: Use sushy.resources.constants.INDICATOR_LED_BLINKING.

sushy.resources.system.constants.SYSTEM_INDICATOR_LED_LIT =
'indicator led lit'
    The Indicator LED is lit

    Deprecated: Use sushy.resources.constants.INDICATOR_LED_LIT.

sushy.resources.system.constants.SYSTEM_INDICATOR_LED_OFF =
'indicator led off'
    The Indicator LED is off

    Deprecated: Use sushy.resources.constants.INDICATOR_LED_OFF.

sushy.resources.system.constants.SYSTEM_INDICATOR_LED_UNKNOWN =
'indicator led unknown'
    The state of the Indicator LED cannot be determine

    Deprecated: Use sushy.resources.constants.INDICATOR_LED_UNKNOWN.

sushy.resources.system.constants.SYSTEM_POWER_STATE_OFF = 'off'
    The system is powered off, although some components may continue to have AUX power such as
    management controller

sushy.resources.system.constants.SYSTEM_POWER_STATE_ON = 'on'
    The system is powered on

sushy.resources.system.constants.SYSTEM_POWER_STATE_POWERING_OFF =
'powering off'
    A temporary state between On and Off. The power off action can take time while the OS is in the
    shutdown process

sushy.resources.system.constants.SYSTEM_POWER_STATE_POWERING_ON =
'powering on'
    A temporary state between Off and On. This temporary state can be very short

sushy.resources.system.constants.SYSTEM_TYPE_COMPOSED = 'Composed'
    A computer system created by binding resource blocks together

sushy.resources.system.constants.SYSTEM_TYPE_OS = 'OS'
    An operating system instance

sushy.resources.system.constants.SYSTEM_TYPE_PHYSICAL = 'Physical'
    A physical computer system

sushy.resources.system.constants.SYSTEM_TYPE_PHYSICALLY_PARTITIONED =
'PhysicallyPartitioned'
    A hardware-based partition of a computer system

sushy.resources.system.constants.SYSTEM_TYPE_VIRTUAL = 'Virtual'
    A virtual machine instance
```

```
sushy.resources.system.constants.SYSTEM_TYPE_VIRTUALLY_PARTITIONED =  
'VirtuallyPartitioned'
```

A virtual or software-based partition of a computer system

### sushy.resources.system.ethernet\_interface module

```
class sushy.resources.system.ethernet_interface.EthernetInterface(connector,  
path='',  
red-  
fish_version=None,  
reg-  
istries=None,  
reader=None,  
json_doc=None,  
root=None)
```

Bases: *sushy.resources.base.ResourceBase*

This class adds the EthernetInterface resource

```
description = <sushy.resources.base.Field object>  
Description
```

```
identity = <sushy.resources.base.Field object>  
The Ethernet Interface identity string
```

```
mac_address = <sushy.resources.base.Field object>  
This is the currently configured MAC address of the interface.
```

```
name = <sushy.resources.base.Field object>  
The name of the resource or array element
```

```
permanent_mac_address = <sushy.resources.base.Field object>  
This is the permanent MAC address assigned to this interface (port)
```

```
speed_mbps = <sushy.resources.base.Field object>  
This is the current speed in Mbps of this interface.
```

```
status = <sushy.resources.common.StatusField object>  
Describes the status and health of this interface.
```

```
class sushy.resources.system.ethernet_interface.EthernetInterfaceCollection(connec  
path,  
red-  
fish_v  
reg-  
istries:  
root=1
```

Bases: *sushy.resources.base.ResourceCollectionBase*

#### property summary

Summary of MAC addresses and interfaces state

This filters the MACs whose health is OK, which means the MACs in both ‘Enabled’ and ‘Disabled’ States are returned.

**Returns** dictionary in the format {‘aa:bb:cc:dd:ee:ff’: `sushy.STATE_ENABLED`,  
‘aa:bb:aa:aa:aa:aa’: `sushy.STATE_DISABLED`}

## `sushy.resources.system.mappings` module

### `sushy.resources.system.processor` module

```
class sushy.resources.system.processor.Processor(connector, identity,
redfish_version=None,
registries=None, root=None)
```

Bases: `sushy.resources.base.ResourceBase`

**identity** = <`sushy.resources.base.Field` object>  
The processor identity string

**instruction\_set** = <`sushy.resources.base.MappedField` object>  
The instruction set of the processor

**manufacturer** = <`sushy.resources.base.Field` object>  
The processor manufacturer

**max\_speed\_mhz** = <`sushy.resources.base.Field` object>  
The maximum clock speed of the processor in MHz.

**model** = <`sushy.resources.base.Field` object>  
The product model number of this device

**processor\_architecture** = <`sushy.resources.base.MappedField` object>  
The architecture of the processor

**processor\_id** =  
<`sushy.resources.system.processor.ProcessorIdField` object>  
The processor id

**processor\_type** = <`sushy.resources.base.MappedField` object>  
The type of processor

**socket** = <`sushy.resources.base.Field` object>  
The socket or location of the processor

**status** = <`sushy.resources.common.StatusField` object>  
The processor status

**property sub\_processors**  
A reference to the collection of Sub-Processors

**total\_cores** = <`sushy.resources.base.Field` object>  
The total number of cores contained in this processor

**total\_threads** = <`sushy.resources.base.Field` object>  
The total number of execution threads supported by this processor

```
class sushy.resources.system.processor.ProcessorCollection(connector,
    path, red-
    fish_version=None,
    reg-
    istrries=None,
    root=None)
```

Bases: *sushy.resources.base.ResourceCollectionBase*

### property summary

Property to provide ProcessorSummary info

It is calculated once when the first time it is queried. On refresh, this property gets reset.

**Returns** A namedtuple containing the count of processors in regards to logical CPUs, and their architecture.

```
class sushy.resources.system.processor.ProcessorIdField(*args, **kwargs)
```

Bases: *sushy.resources.base.CompositeField*

**effective\_family** = <*sushy.resources.base.Field* object>

The processor effective family

**effective\_model** = <*sushy.resources.base.Field* object>

The processor effective model

**identification\_registers** = <*sushy.resources.base.Field* object>

The processor identification registers

**microcode\_info** = <*sushy.resources.base.Field* object>

The processor microcode info

**step** = <*sushy.resources.base.Field* object>

The processor stepping

**vendor\_id** = <*sushy.resources.base.Field* object>

The processor vendor id

```
class sushy.resources.system.processor.ProcessorSummary(count, architecture)
```

Bases: tuple

### architecture

Alias for field number 1

### count

Alias for field number 0

## **sushy.resources.system.secure\_boot module**

```
class sushy.resources.system.secure_boot.ActionsField(*args, **kwargs)
```

Bases: *sushy.resources.base.CompositeField*

**reset\_keys** =

<*sushy.resources.system.secure\_boot.ResetKeysActionField* object>  
Action that resets the UEFI Secure Boot keys.

```
class sushy.resources.system.secure_boot.ResetKeysActionField(*args,
    **kwargs)
```

Bases: *sushy.resources.common.ActionField*

```
allowed_values = <sushy.resources.base.Field object>

class sushy.resources.system.secure_boot.SecureBoot(connector, path,
                                                 redfish_version=None,
                                                 registries=None,
                                                 root=None)

Bases: sushy.resources.base.ResourceBase

current_boot = <sushy.resources.base.MappedField object>
    The UEFI Secure Boot state during the current boot cycle.

property databases
    A collection of secure boot databases.

    It is set once when the first time it is queried. On refresh, this property is marked as stale
    (greedy-refresh not done). Here the actual refresh of the sub-resource happens, if stale.

    Raises MissingAttributeError if ‘SecureBootDatabases/@odata.id’ field is missing.

    Returns SimpleStorageCollection instance

description = <sushy.resources.base.Field object>
    Human-readable description of the BIOS resource

enabled = <sushy.resources.base.Field object>
    Whether the UEFI Secure Boot takes effect on next boot.

    This property can be enabled in UEFI boot mode only.

get_allowed_reset_keys_values()
    Get the allowed values for resetting the keys.

    Returns A set with the allowed values.

identity = <sushy.resources.base.Field object>
    The Bios resource identity string

mode = <sushy.resources.base.MappedField object>
    The current UEFI Secure Boot Mode.

name = <sushy.resources.base.Field object>
    The name of the resource

reset_keys(reset_type)
    Reset secure boot keys.

    Parameters reset_type – Reset type, one of SECURE_BOOT_RESET_KEYS_*
    constants.

set_enabled(enabled)
    Enable/disable secure boot.

    Parameters enabled – True, if secure boot is enabled for next boot.
```

## sushy.resources.system.secure\_boot\_database module

```
class sushy.resources.system.secure_boot_database.ActionsField(*args,
                                                               **kwargs)
Bases: sushy.resources.base.CompositeField

reset_keys = <sushy.resources.system.secure_boot_database.
ResetKeysActionField
object>
    Action that resets the UEFI Secure Boot keys.

class sushy.resources.system.secure_boot_database.ResetKeysActionField(*args,
                                                               **kwargs)
Bases: sushy.resources.common.ActionField

allowed_values = <sushy.resources.base.Field object>

class sushy.resources.system.secure_boot_database.SecureBootDatabase(connector,
                                                               path='',
                                                               red-
                                                               fish_version=None,
                                                               reg-
                                                               istries=None,
                                                               reader=None,
                                                               json_doc=None,
                                                               root=None)
Bases: sushy.resources.base.ResourceBase

database_id = <sushy.resources.base.MappedField object>
    Standard UEFI database type.

description = <sushy.resources.base.Field object>
    The system description

get_allowed_reset_keys_values()
    Get the allowed values for resetting the keys.

    Returns A set with the allowed values.

identity = <sushy.resources.base.Field object>
    The secure boot database identity string

name = <sushy.resources.base.Field object>
    The secure boot database name

reset_keys (reset_type)
    Reset secure boot keys.

    Parameters reset_type – Reset type, one of SECURE_BOOT_RESET_KEYS_*
    constants.
```

```
class sushy.resources.system.secure_boot_database.SecureBootDatabaseCollection(conn,  
    path="/redfish/v1/SecureBootDatabase", reader=None,  
    registries=None, json_doc=None, root=None)
```

Bases: *sushy.resources.base.ResourceCollectionBase*

## sushy.resources.system.simple\_storage module

```
class sushy.resources.system.simple_storage.DeviceListField(*args,  
    **kwargs)
```

Bases: *sushy.resources.base.ListField*

The storage device/s associated with SimpleStorage.

**capacity\_bytes** = <*sushy.resources.base.Field object*>

The size of the storage device.

**name** = <*sushy.resources.base.Field object*>

The name of the storage device

**status** = <*sushy.resources.common.StatusField object*>

Describes the status and health of a storage device.

```
class sushy.resources.system.simple_storage.SimpleStorage(connector,  
    path="/redfish/v1/Storage", reader=None,  
    registries=None, json_doc=None, root=None)
```

Bases: *sushy.resources.base.ResourceBase*

This class represents a simple storage.

It represents the properties of a storage controller and its directly-attached devices. A storage device can be a disk drive or optical media device.

**devices** = <*sushy.resources.system.simple\_storage.DeviceListField object*>

The storage devices associated with this resource.

**identity** = <*sushy.resources.base.Field object*>

The SimpleStorage identity string

**name** = <*sushy.resources.base.Field object*>

The name of the resource

```
class sushy.resources.system.simple_storage.SimpleStorageCollection(connector,
    path,
    red-
    fish_version=None,
    reg-
    istries=None,
    root=None)
```

Bases: *sushy.resources.base.ResourceCollectionBase*

Represents a collection of simple storage associated with system.

**property disks\_sizes\_bytes**

Sizes of each Disk in bytes in SimpleStorage collection resource.

Returns the list of cached values until it (or its parent resource) is refreshed.

**property max\_size\_bytes**

Max size available (in bytes) among all enabled Disk resources.

Returns the cached value until it (or its parent resource) is refreshed.

## **sushy.resources.system.system module**

```
class sushy.resources.system.system.ActionsField(*args, **kwargs)
Bases: sushy.resources.base.CompositeField
```

**reset** = <sushy.resources.common.ResetActionField object>

```
class sushy.resources.system.system.BootField(*args, **kwargs)
Bases: sushy.resources.base.CompositeField
```

**allowed\_values** = <sushy.resources.base.Field object>

**enabled** = <sushy.resources.base.MappedField object>

**mode** = <sushy.resources.base.MappedField object>

**target** = <sushy.resources.base.MappedField object>

```
class sushy.resources.system.system.MemorySummaryField(*args, **kwargs)
Bases: sushy.resources.base.CompositeField
```

**health** = <sushy.resources.base.Field object>

The overall health state of memory.

This signifies health state of memory along with its dependent resources.

**size\_gib** = <sushy.resources.base.Field object>

The size of memory of the system in GiB.

This signifies the total installed, operating system-accessible memory (RAM), measured in GiB.

```
class sushy.resources.system.system.System(connector, identity,
    redfish_version=None, registries=None,
    root=None)
```

Bases: *sushy.resources.base.ResourceBase*

**asset\_tag** = <sushy.resources.base.Field object>

The system asset tag

**property bios**

Property to reference *Bios* instance

It is set once when the first time it is queried. On refresh, this property is marked as stale (greedy-refresh not done). Here the actual refresh of the sub-resource happens, if stale.

**bios\_version = <sushy.resources.base.Field object>**

The system BIOS version

**boot = <sushy.resources.system.system.BootField object>**

A dictionary containing the current boot device, frequency and mode

**property chassis**

A list of chassis where this system resides.

Returns a list of *Chassis* objects representing the chassis or cabinets where this system is mounted.

**Raises** MissingAttributeError if ‘@odata.id’ field is missing.

**Returns** A list of *Chassis* instances

**description = <sushy.resources.base.Field object>**

The system description

**property ethernet\_interfaces**

Property to reference *EthernetInterfaceCollection* instance

It is set once when the first time it is queried. On refresh, this property is marked as stale (greedy-refresh not done). Here the actual refresh of the sub-resource happens, if stale.

**get\_allowed\_reset\_system\_values()**

Get the allowed values for resetting the system.

**Returns** A set with the allowed values.

**get\_allowed\_system\_boot\_source\_values()**

Get the allowed values for changing the boot source.

**Returns** A set with the allowed values.

**hostname = <sushy.resources.base.Field object>**

The system hostname

**identity = <sushy.resources.base.Field object>**

The system identity string

**indicator\_led = <sushy.resources.base.MappedField object>**

Whether the indicator LED is lit or off

**maintenance\_window =****<sushy.resources.settings.MaintenanceWindowField object>**

Indicates if a given resource has a maintenance window assignment for applying settings or operations

**property managers**

A list of managers for this system.

Returns a list of *Manager* objects representing the managers that manage this system.

**Raises** MissingAttributeError if ‘@odata.id’ field is missing.

**Returns** A list of *Manager* instances

**manufacturer** = <sushy.resources.base.Field object>  
The system manufacturer

**memory\_summary** =  
<sushy.resources.system.system.MemorySummaryField object>  
The summary info of memory of the system in general detail

**name** = <sushy.resources.base.Field object>  
The system name

**part\_number** = <sushy.resources.base.Field object>  
The system part number

**power\_state** = <sushy.resources.base.MappedField object>  
The system power state

**property processors**

Property to reference *ProcessorCollection* instance

It is set once when the first time it is queried. On refresh, this property is marked as stale (greedy-refresh not done). Here the actual refresh of the sub-resource happens, if stale.

**reset\_system** (*value*)

Reset the system.

**Parameters** **value** – The target value.

**Raises** InvalidParameterValueError, if the target value is not allowed.

**property secure\_boot**

Property to reference *SecureBoot* instance

It is set once when the first time it is queried. On refresh, this property is marked as stale (greedy-refresh not done). Here the actual refresh of the sub-resource happens, if stale.

**serial\_number** = <sushy.resources.base.Field object>

The system serial number

**set\_indicator\_led** (*state*)

Set IndicatorLED to the given state.

**Parameters** **state** – Desired LED state, lit (INDICATOR\_LED\_LIT), blinking (INDICATOR\_LED\_BLINKING), off (INDICATOR\_LED\_OFF)

**Raises** InvalidParameterValueError, if any information passed is invalid.

**set\_system\_boot\_options** (*target=None*, *enabled=None*, *mode=None*)

Set boot source and/or boot frequency and/or boot mode.

Set the boot source and/or boot frequency and/or boot mode to use on next reboot of the System.

**Parameters**

- **target** – The target boot source, optional.
- **enabled** – The frequency, whether to set it for the next reboot only (BOOT\_SOURCE\_ENABLED\_ONCE) or persistent to all future reboots (BOOT\_SOURCE\_ENABLED\_CONTINUOUS) or disabled (BOOT\_SOURCE\_ENABLED\_DISABLED), optional.

- **mode** – The boot mode (UEFI: BOOT\_SOURCE\_MODE\_UEFI or BIOS: BOOT\_SOURCE\_MODE\_BIOS), optional.

**Raises** InvalidParameterValueError, if any information passed is invalid.

**set\_system\_boot\_source** (*target*, *enabled*='once', *mode*=None)

Set boot source and/or boot frequency and/or boot mode.

Set the boot source and/or boot frequency and/or boot mode to use on next reboot of the System.

This method is obsoleted by *set\_system\_boot\_options*.

**Parameters**

- **target** – The target boot source.
- **enabled** – The frequency, whether to set it for the next reboot only (BOOT\_SOURCE\_ENABLED\_ONCE) or persistent to all future reboots (BOOT\_SOURCE\_ENABLED\_CONTINUOUS) or disabled (BOOT\_SOURCE\_ENABLED\_DISABLED). Default is *BOOT\_SOURCE\_ENABLED\_ONCE*.
- **mode** – The boot mode (UEFI: BOOT\_SOURCE\_MODE\_UEFI or BIOS: BOOT\_SOURCE\_MODE\_BIOS), optional.

**Raises** InvalidParameterValueError, if any information passed is invalid.

**property simple\_storage**

A collection of simple storage associated with system.

This returns a reference to *SimpleStorageCollection* instance. SimpleStorage represents the properties of a storage controller and its directly-attached devices.

It is set once when the first time it is queried. On refresh, this property is marked as stale (greedy-refresh not done). Here the actual refresh of the sub-resource happens, if stale.

**Raises** MissingAttributeError if ‘SimpleStorage/@odata.id’ field is missing.

**Returns** *SimpleStorageCollection* instance

**sku** = <sushy.resources.base.Field object>

The system stock-keeping unit

**status** = <sushy.resources.common.StatusField object>

The system status

**property storage**

A collection of storage subsystems associated with system.

This returns a reference to *StorageCollection* instance. A storage subsystem represents a set of storage controllers (physical or virtual) and the resources such as drives and volumes that can be accessed from that subsystem.

It is set once when the first time it is queried. On refresh, this property is marked as stale (greedy-refresh not done). Here the actual refresh of the sub-resource happens, if stale.

**Raises** MissingAttributeError if ‘Storage/@odata.id’ field is missing.

**Returns** *StorageCollection* instance

```
system_type = <sushy.resources.base.MappedField object>
    The system type

uuid = <sushy.resources.base.Field object>
    The system UUID

class sushy.resources.system.system.SystemCollection(connector, path,
                                                       redfish_version=None,
                                                       registries=None,
                                                       root=None)

Bases: sushy.resources.base.ResourceCollectionBase
```

### Module contents

#### **sushy.resources.taskservice package**

##### Submodules

###### **sushy.resources.taskservice.constants module**

###### **sushy.resources.taskservice.mappings module**

###### **sushy.resources.taskservice.task module**

```
class sushy.resources.taskservice.task.Task(connector, identity,
                                              redfish_version=None,
                                              registries=None, json_doc=None,
                                              root=None)

Bases: sushy.resources.base.ResourceBase
```

**description = <sushy.resources.base.Field object>**

The Task description

**end\_time = <sushy.resources.base.Field object>**

End time of the Task

**identity = <sushy.resources.base.Field object>**

The Task identity

**property is\_processing**

Indicates if the Task is processing

**messages = <sushy.resources.base.MessageListField object>**

List of *MessageListField* with messages from the Task

**name = <sushy.resources.base.Field object>**

The Task name

**parse\_messages()**

Parses the messages

**percent\_complete = <sushy.resources.base.Field object>**

Percentage complete of the Task

```
start_time = <sushy.resources.base.Field object>
    Start time of the Task

task_monitor = <sushy.resources.base.Field object>
    An opaque URL that the client can use to monitor an asynchronous operation

task_state = <sushy.resources.base.MappedField object>
    The Task state

task_status = <sushy.resources.base.MappedField object>
    The Task status

class sushy.resources.taskservice.task.TaskCollection(connector, path,
                                                       redfish_version=None,
                                                       registries=None,
                                                       root=None)
```

Bases: *sushy.resources.base.ResourceCollectionBase*

#### **property summary**

Summary of task ids and corresponding state

**Returns** dictionary in the format {'jid\_123456789': sushy.TASK\_STATE\_NEW, 'jid\_123454321': sushy.TASK\_STATE\_RUNNING}

## **sushy.resources.taskservice.taskmonitor module**

```
sushy.resources.taskservice.taskmonitor.TaskMonitor(connector, task_monitor,
                                                       redfish_version=None,
                                                       registries=None,
                                                       field_data=None)
```

A class representing a task monitor

Deprecated, use sushy.taskmonitor.TaskMonitor.

#### **Parameters**

- **connector** – A Connector instance
- **task\_monitor** – The task monitor URI
- **redfish\_version** – The version of RedFish. Used to construct the object according to schema of the given version.
- **registries** – Dict of Redfish Message Registry objects to be used in any resource that needs registries to parse messages.
- **field\_data** – the data to use populating the fields.

## sushy.resources.taskservice.taskservice module

```
class sushy.resources.taskservice.taskservice.TaskService(connector,
    identity, red-
    fish_version=None,
    registries=None,
    root=None)
```

Bases: `sushy.resources.base.ResourceBase`

**event\_on\_task\_state\_change** = <`sushy.resources.base.Field object`>  
Whether a task state change sends an event

**identity** = <`sushy.resources.base.Field object`>  
The task service identity

**name** = <`sushy.resources.base.Field object`>  
The task service name

**overwrite\_policy** = <`sushy.resources.base.MappedField object`>  
The overwrite policy for completed tasks

**service\_enabled** = <`sushy.resources.base.Field object`>  
The status of whether this service is enabled

**status** = <`sushy.resources.common.StatusField object`>  
The status of the task service

**property tasks**  
Property to reference `TaskCollection` instance

It is set once when the first time it is queried. On refresh, this property is marked as stale (greedy-refresh not done). Here the actual refresh of the sub-resource happens, if stale.

### sushy.resources.updateservice package

#### Submodules

##### sushy.resources.updateservice.constants module

##### sushy.resources.updateservice.mappings module

**sushy.resources.updateservice.softwareinventory module**

```
class sushy.resources.updateservice.softwareinventory.SoftwareInventory(connector,
    iden-
    tity,
    red-
    fish_version
    reg-
    istries=None
    root=None)

Bases: sushy.resources.base.ResourceBase

identity = <sushy.resources.base.Field object>
    The software inventory identity

lowest_supported_version = <sushy.resources.base.Field object>
    The lowest supported version of the software

manufacturer = <sushy.resources.base.Field object>
    The manufacturer of the software

name = <sushy.resources.base.Field object>
    The software inventory name

related_item = <sushy.resources.base.Field object>
    The ID(s) of the resources associated with the software inventory item

release_date = <sushy.resources.base.Field object>
    Release date of the software

software_id = <sushy.resources.base.Field object>
    The identity of the software

status = <sushy.resources.common.StatusField object>
    The status of the software inventory

uefi_device_paths = <sushy.resources.base.Field object>
    Represents the UEFI Device Path(s)

updateable = <sushy.resources.base.Field object>
    Indicates whether this software can be updated by the update service

version = <sushy.resources.base.Field object>
    The version of the software

class sushy.resources.updateservice.softwareinventory.SoftwareInventoryCollection
```

Bases: *sushy.resources.base.ResourceCollectionBase*

```
description = <sushy.resources.base.Field object>
    The software inventory collection description
```

```
name = <sushy.resources.base.Field object>
```

The software inventory collection name

## sushy.resources.updateservice.updateservice module

```
class sushy.resources.updateservice.updateservice.ActionsField(*args,
                                                               **kwargs)
Bases: sushy.resources.base.CompositeField

simple_update = <sushy.resources.common.ActionField object>

class sushy.resources.updateservice.updateservice.UpdateService(connector,
                                                               iden-
                                                               tity,
                                                               red-
                                                               fish_version=None,
                                                               reg-
                                                               istries=None,
                                                               root=None)
Bases: sushy.resources.base.ResourceBase

property firmware_inventory
    Property to reference FirmwareInventory collection instance

get_allowed_transfer_protocols()
    Get the allowed values for transfer protocol.

    Returns A set of allowed values.

    Raises MissingAttributeError, if Actions/#UpdateService.SimpleUpdate attribute
          not present.

get_task_monitor(task_monitor)
    Used to retrieve a TaskMonitor.

    Deprecated: Use sushy.Sushy.get_task_monitor :returns: A task monitor.

http_push_uri = <sushy.resources.base.Field object>
    The URI used to perform an HTTP or HTTPS push update to the Update Service

http_push_uri_targets = <sushy.resources.base.Field object>
http_push_uri_targets_busy = <sushy.resources.base.Field object>

identity = <sushy.resources.base.Field object>
    The update service identity

name = <sushy.resources.base.Field object>
    The update service name

service_enabled = <sushy.resources.base.Field object>
    The status of whether this service is enabled

simple_update(image_uri, targets=None, transfer_protocol='Hypertext Transport Protocol')
    Simple Update is used to update software components.

    Returns A task monitor.
```

```
property software_inventory
    Property to reference SoftwareInventory collection instance

status = <sushy.resources.common.StatusField object>
    The status of the update service
```

## Module contents

### Submodules

#### sushy.resources.base module

```
class sushy.resources.base.AbstractDataReader
Bases: object
```

```
abstract get_data()
    Based on data source get data and parse to JSON
```

```
set_connection(connector, path)
    Sets mandatory connection parameters
```

#### Parameters

- **connector** – A Connector instance
- **path** – path of the resource

```
class sushy.resources.base.CompositeField(*args, **kwargs)
Bases: collections.abc.Mapping, sushy.resources.base.Field
```

Base class for fields consisting of several sub-fields.

```
class sushy.resources.base.DictionaryField(*args, **kwargs)
Bases: sushy.resources.base.Field
```

Base class for fields consisting of dictionary of several sub-fields.

```
class sushy.resources.base.Field(path, required=False, default=None,
                                         adapter=<function Field.<lambda>>)
Bases: object
```

Definition for fields fetched from JSON.

```
class sushy.resources.base.FieldData(status_code, headers, json_doc)
Bases: object
```

Contains data to be used when constructing Fields

#### property headers

The headers

#### property json\_doc

The parsed JSON body

#### property status\_code

The status code

```
class sushy.resources.base.JsonArchiveReader(archive_file)
    Bases: sushy.resources.base.AbstractDataReader

    Gets the data from JSON file in archive

    get_data()
        Gets JSON file from archive. Currently supporting ZIP only

class sushy.resources.base.JsonDataReader
    Bases: sushy.resources.base.AbstractDataReader

    Gets the data from HTTP response given by path

    get_data()
        Gets JSON file from URI directly

class sushy.resources.base.JsonPackagedFileReader(resource_package_name)
    Bases: sushy.resources.base.AbstractDataReader

    Gets the data from packaged file given by path

    get_data()
        Gets JSON file from packaged file denoted by path

class sushy.resources.base.JsonPublicFileReader
    Bases: sushy.resources.base.AbstractDataReader

    Loads the data from the Internet

    get_data()
        Get JSON file from full URI

class sushy.resources.base.LinksField(*args, **kwargs)
    Bases: sushy.resources.base.CompositeField

    Reference to linked resources.

    oem_vendors = <sushy.resources.base.Field object>

class sushy.resources.base.ListField(*args, **kwargs)
    Bases: sushy.resources.base.Field

    Base class for fields consisting of a list of several sub-fields.

class sushy.resources.base.MappedField(field, mapping, required=False,
                                         default=None)
    Bases: sushy.resources.base.Field

    Field taking real value from a mapping.

class sushy.resources.base.MappedListField(field, mapping, required=False,
                                         default=None)
    Bases: sushy.resources.base.Field

    Field taking a list of values with a mapping for the values

    Given JSON {‘field’:[‘xxx’, ‘yyy’]}, a sushy resource definition and mapping {‘xxx’:‘a’, ‘yyy’:‘b’}, the
    sushy object to come out will be like resource.field = [‘a’, ‘b’]

class sushy.resources.base.MessageListField(*args, **kwargs)
    Bases: sushy.resources.base.ListField

    List of messages with details of settings update status
```

---

```

message = <sushy.resources.base.Field object>
    Human readable message, if provided

message_args = <sushy.resources.base.Field object>
    List of message substitution arguments for the message referenced by message_id from the
    message registry

message_id = <sushy.resources.base.Field object>
    The key for this message which can be used to look up the message in a message registry

resolution = <sushy.resources.base.Field object>
    Used to provide suggestions on how to resolve the situation that caused the error

severity = <sushy.resources.base.MappedField object>
    Severity of the error

class sushy.resources.base.ResourceBase(connector, path='', redfish_version=None,
                                         registries=None, reader=None,
                                         json_doc=None, root=None)
Bases: object

clone_resource (new_resource, path= '')
    Instantiate given resource using existing BMC connection context

get_oem_extension (vendor)
    Get the OEM extension instance for this resource by OEM vendor

    Parameters vendor – the OEM vendor string which is the vendor-specific exten-
        sibility identifier. Examples are ‘Contoso’, ‘Hpe’. Possible value can be got from
        oem_vendors attribute.

    Returns the Redfish resource OEM extension instance.

    Raises OEMExtensionNotFoundError

invalidate (force_refresh=False)
    Mark the resource as stale, prompting refresh() before getting used.

    If force_refresh is set to True, then it invokes refresh() on the resource.

    Parameters force_refresh – will invoke refresh on the resource, if set to True.

    Raises ResourceNotFoundError

    Raises ConnectionError

    Raises HTTPError

property json
links = <sushy.resources.base.LinksField object>
property oem_vendors
property path
redfish_version = None
    The Redfish version

refresh (force=True, json_doc=None)
    Refresh the resource

```

Freshly retrieves/fetches the resource attributes and invokes `_parse_attributes()` method on successful retrieval. It is recommended not to override this method in concrete ResourceBase classes. Resource classes can place their refresh specific operations in `_do_refresh()` method, if needed. This method represents the template method in the paradigm of Template design pattern.

**Parameters**

- **force** – if set to False, will only refresh if the resource is marked as stale, otherwise neither it nor its subresources will be refreshed.
- **json\_doc** – parsed JSON document in form of Python types.

**Raises** ResourceNotFoundError

**Raises** ConnectionError

**Raises** HTTPError

**property registries**

**property resource\_name**

**property root**

```
class sushy.resources.base.ResourceCollectionBase(connector, path,
                                                 redfish_version=None,
                                                 registries=None, root=None)
```

Bases: [sushy.resources.base.ResourceBase](#)

**get\_member (identity)**

Given the identity return a `_resource_type` object

**Parameters** `identity` – The identity of the `_resource_type`

**Returns** The `_resource_type` object

**Raises** ResourceNotFoundError

**get\_members ()**

Return a list of `_resource_type` objects present in collection

**Returns** A list of `_resource_type` objects

**members\_identities** = <[sushy.resources.base.Field object](#)>

A tuple with the members identities

**name** = <[sushy.resources.base.Field object](#)>

The name of the collection

```
sushy.resources.base.get_reader(connector, path, reader=None)
```

Create and configure the reader.

**Parameters**

- **connector** – A Connector instance
- **path** – sub-URI path to the resource.
- **reader** – Reader to use to fetch JSON data.

**Returns** the reader

## sushy.resources.common module

```
class sushy.resources.common.ActionField(*args, **kwargs)
    Bases: sushy.resources.base.CompositeField

        operation_apply_time_support =
            <sushy.resources.common.OperationApplyTimeSupportField object>

        target_uri = <sushy.resources.base.Field object>

class sushy.resources.common.IdRefField(*args, **kwargs)
    Bases: sushy.resources.base.CompositeField

        Reference to the resource odata identity field.

        resource_uri = <sushy.resources.base.Field object>
            The unique identifier for a resource

class sushy.resources.common.IdentifiersListField(*args, **kwargs)
    Bases: sushy.resources.base.ListField

        This type describes any additional identifiers for a resource.

        durable_name = <sushy.resources.base.Field object>
            This indicates the world wide, persistent name of the resource.

        durable_name_format = <sushy.resources.base.MappedField object>
            This represents the format of the DurableName property.

class sushy.resources.common.InitializeActionField(*args, **kwargs)
    Bases: sushy.resources.common.ActionField

        allowed_values = <sushy.resources.base.Field object>

class sushy.resources.common.OperationApplyTimeSupportField
    Bases: sushy.resources.base.CompositeField

        maintenance_window_duration_in_seconds =
            <sushy.resources.base.Field object>
                The expiry time of maintenance window in seconds

        maintenance_window_start_time = <sushy.resources.base.Field
            object>
                The start time of a maintenance window

        mapped_supported_values = <sushy.resources.base.MappedListField
            object>
                The types of apply times that the client is allowed request when performing a create, delete, or
                action operation returned as a mapped list

        supported_values = <sushy.resources.base.Field object>
                The types of apply times that the client is allowed request when performing a create, delete, or
                action operation returned as an unmapped list

                Deprecated: Use mapped_supported_values.

class sushy.resources.common.ResetActionField(*args, **kwargs)
    Bases: sushy.resources.common.ActionField

        allowed_values = <sushy.resources.base.Field object>
```

```
class sushy.resources.common.StatusField(*args, **kwargs)
```

```
Bases: sushy.resources.base.CompositeField
```

This Field describes the status of a resource and its children.

This field shall contain any state or health properties of a resource.

```
health = <sushy.resources.base.MappedField object>
```

Represents health of resource w/o considering its dependent resources

```
health_rollup = <sushy.resources.base.MappedField object>
```

Represents health state of resource and its dependent resources

```
state = <sushy.resources.base.MappedField object>
```

Indicates the known state of the resource, such as if it is enabled.

## sushy.resources.constants module

```
sushy.resources.constants.INDICATOR_LED_BLINKING = 'indicator led  
blinking'
```

The Indicator LED is blinking

```
sushy.resources.constants.INDICATOR_LED_LIT = 'indicator led lit'
```

The Indicator LED is lit

```
sushy.resources.constants.INDICATOR_LED_OFF = 'indicator led off'
```

The Indicator LED is off

```
sushy.resources.constants.INDICATOR_LED_UNKNOWN = 'indicator led  
unknown'
```

The state of the Indicator LED cannot be determine

```
sushy.resources.constants.POWER_STATE_OFF = 'off'
```

The resource is powered off, although some components may continue to have AUX power such as management controller

```
sushy.resources.constants.POWER_STATE_ON = 'on'
```

The resource is powered on

```
sushy.resources.constants.POWER_STATE_POWERING_OFF = 'powering off'
```

A temporary state between On and Off. The power off action can take time while the OS is in the shutdown process

```
sushy.resources.constants.POWER_STATE_POWERING_ON = 'powering on'
```

A temporary state between Off and On. This temporary state can be very short

```
sushy.resources.constants.RESET_TYPE_FORCE_OFF = 'force off'
```

Turn the unit off immediately (non-graceful shutdown)

```
sushy.resources.constants.RESET_TYPE_FORCE_ON = 'force on'
```

Turn the unit on immediately

```
sushy.resources.constants.RESET_TYPE_FORCE_RESTART = 'force restart'
```

Perform an immediate (non-graceful) shutdown, followed by a restart

```
sushy.resources.constants.RESET_TYPE_GRACEFUL_RESTART = 'graceful  
restart'
```

Perform a graceful shutdown followed by a restart of the system

```
sushy.resources.constants.RESET_TYPE_GRACEFUL_SHUTDOWN = 'graceful shutdown'
    Perform a graceful shutdown and power off

sushy.resources.constants.RESET_TYPE_NMI = 'nmi'
    Generate a Diagnostic Interrupt (usually an NMI on x86 systems) to cease normal operations, perform diagnostic actions and typically halt the system

sushy.resources.constants.RESET_TYPE_ON = 'on'
    Turn the unit on

sushy.resources.constants.RESET_TYPE_POWER_CYCLE = 'power cycle'
    Perform a power cycle of the unit

sushy.resources.constants.RESET_TYPE_PUSH_POWER_BUTTON = 'push power button'
    Simulate the pressing of the physical power button on this unit
```

## sushy.resources.mappings module

### sushy.resources.settings module

```
class sushy.resources.settings.MaintenanceWindowField(*args, **kwargs)
    Bases: sushy.resources.base.CompositeField

    maintenance_window_duration_in_seconds =
        <sushy.resources.base.Field object>
            The expiry time of maintenance window in seconds

    maintenance_window_start_time = <sushy.resources.base.Field object>
        The start time of a maintenance window

sushy.resources.settings.NO_UPDATES = 4
    No updates made

class sushy.resources.settings.SettingsApplyTimeField
    Bases: sushy.resources.base.CompositeField

    apply_time = <sushy.resources.base.Field object>
        When the future configuration should be applied

    apply_time_allowable_values = <sushy.resources.base.Field object>
        The list of allowable ApplyTime values

    maintenance_window_duration_in_seconds =
        <sushy.resources.base.Field object>
            The expiry time of maintenance window in seconds

    maintenance_window_start_time = <sushy.resources.base.Field object>
        The start time of a maintenance window

class sushy.resources.settings.SettingsField
    Bases: sushy.resources.base.CompositeField

    The settings of a resource
```

Represents the future state and configuration of the resource. The field is added to resources that support future state and configuration.

This field includes several properties to help clients monitor when the resource is consumed by the service and determine the results of applying the values, which may or may not have been successful.

### **commit** (*connector, value*)

Commits new settings values

The new values will be applied when the system or a service restarts.

#### **Parameters**

- **connector** – A Connector instance
- **value** – Value representing JSON whose structure is specific to each resource and the caller must format it correctly

### **get\_status** (*registries*)

Determines the status of last update based

Uses message id-s and severity to determine the status.

**Parameters** **registries** – registries to use to parse message

**Returns** *SettingsUpdate* object containing status and any messages

### **property maintenance\_window**

MaintenanceWindow field

Indicates if a given resource has a maintenance window assignment for applying settings or operations

### **messages = <sushy.resources.base.MessageListField object>**

Represents the results of the last time the values of the Settings resource were applied to the server

### **property operation\_apply\_time\_support**

OperationApplyTimeSupport field

Indicates if a client is allowed to request for a specific apply time of a create, delete, or action operation of a given resource

### **property resource\_uri**

### **time = <sushy.resources.base.Field object>**

Indicates the time the settings were applied to the server

## **class sushy.resources.settings.SettingsUpdate (status, messages)**

Bases: object

Contains Settings update status and details of the update

### **property messages**

List of *MessageListField* with messages from the update

### **property status**

The status of the update

## **sushy.resources.settings.UPDATE\_FAILURE = 2**

Update encountered errors

```
sushy.resources.settings.UPDATE_PENDING = 3
    Update waiting for being applied

sushy.resources.settings.UPDATE_SUCCESS = 1
    Update was successful

sushy.resources.settings.UPDATE_UNKNOWN = 0
    Update status unknown
```

## sushy.resources.task\_monitor module

```
class sushy.resources.task_monitor.TaskMonitor(connector, path='',
                                                redfish_version=None,
                                                root=None)
```

Bases: *sushy.resources.base.ResourceBase*

Deprecated: Use `sushy.taskmonitor.TaskMonitor`

### **property in\_progress**

Checks the status of the async task

**Returns** True if the async task is still in progress, False otherwise

### **property location\_header**

The Location header returned from the GET on the Task Monitor

**Returns** The Location header (an absolute URL)

### **property response**

The response from the last TaskMonitor in\_progress check

**Returns** The `requests` response object or None

### **property retry\_after**

Time the client should wait before querying the task status

**Returns** The Retry-After time in `datetime` format

### **set\_retry\_after(value)**

Set the time the client should wait before querying the task status

**Parameters** `value` – The value of the Retry-After header, which can be the number of seconds to wait or an `HTTP-date` string as defined by RFC 7231

**Returns** The TaskMonitor object

### **property sleep\_for**

Seconds the client should wait before querying the operation status

**Returns** The number of seconds to wait

## Module contents

### Submodules

#### sushy.auth module

**class** `sushy.auth.AuthBase (username=None, password=None)`

Bases: `object`

**authenticate ()**

Perform authentication.

**Raises** `RuntimeError`

**abstract can\_refresh\_session ()**

Method to assert if session based refresh can be done.

**close ()**

Shutdown Redfish authentication object

Undoes whatever should be undone to cancel authenticated session.

**set\_context (root\_resource, connector)**

Set the context of the authentication object.

#### Parameters

- **root\_resource** – Root sushy object
- **connector** – Connector for http connections

**class** `sushy.auth.BasicAuth (username=None, password=None)`

Bases: `sushy.auth.AuthBase`

Basic Authentication class.

This is a class used to encapsulate a basic authentication session.

#### Parameters

- **username** – User account with admin/server-profile access privilege.
- **password** – User account password.

**can\_refresh\_session ()**

Method to assert if session based refresh can be done.

**class** `sushy.auth.SessionAuth (username=None, password=None)`

Bases: `sushy.auth.AuthBase`

Session Authentication class.

This is a class used to encapsulate a redfish session.

**can\_refresh\_session ()**

Method to assert if session based refresh can be done.

**close ()**

Close the Redfish Session.

Attempts to close an established RedfishSession by deleting it from the remote Redfish controller.

**get\_session\_key()**

Returns the session key.

**Returns** The session key.

**get\_session\_resource\_id()**

Returns the session resource id.

**Returns** The session resource id.

**refresh\_session()**

Method to refresh a session to a Redfish controller.

This method is called to create a new session after a session that has already been established has timed-out or expired.

**Raises** MissingXAuthToken

**Raises** ConnectionError

**Raises** AccessError

**Raises** HTTPError

**reset\_session\_attrs()**

Reset active session related attributes.

**class** `sushy.auth.SessionOrBasicAuth` (`username=None, password=None`)

Bases: `sushy.auth.SessionAuth`

**refresh\_session()**

Method to refresh a session to a Redfish controller.

This method is called to create a new RedfishSession if we have previously established a RedfishSession and the previous session has timed-out or expired. If we did not previously have an established session, we simply return our BasicAuthentication requests.Session.

## sushy.connector module

**class** `sushy.connector.Connector` (`url, username=None, password=None, verify=True, response_callback=None`)

Bases: `object`

**check\_retry\_on\_exception(exception\_msg)**

Checks whether retry on exception is required.

**close()**

Close this connector and the associated HTTP session.

**delete(path='', data=None, headers=None, blocking=False, timeout=60, \*\*extra\_session\_req\_kwargs)**

HTTP DELETE method.

### Parameters

- **path** – Optional sub-URI path to the resource.

- **data** – Optional JSON data.
- **headers** – Optional dictionary of headers.
- **blocking** – Whether to block for asynchronous operations.
- **timeout** – Max time in seconds to wait for blocking async call.
- **extra\_session\_req\_kwargs** – Optional keyword argument to pass requests library arguments which would pass on to requests session object.

**Returns** The response object from the requests library.

**Raises** ConnectionError

**Raises** HTTPError

```
get (path='', data=None, headers=None, blocking=False, timeout=60,  
     **extra_session_req_kwargs)  
HTTP GET method.
```

#### Parameters

- **path** – Optional sub-URI path to the resource.
- **data** – Optional JSON data.
- **headers** – Optional dictionary of headers.
- **blocking** – Whether to block for asynchronous operations.
- **timeout** – Max time in seconds to wait for blocking async call.
- **extra\_session\_req\_kwargs** – Optional keyword argument to pass requests library arguments which would pass on to requests session object.

**Returns** The response object from the requests library.

**Raises** ConnectionError

**Raises** HTTPError

```
patch (path='', data=None, headers=None, etag=None, blocking=False, timeout=60,  
       **extra_session_req_kwargs)  
HTTP PATCH method.
```

#### Parameters

- **path** – Optional sub-URI path to the resource.
- **data** – Optional JSON data.
- **headers** – Optional dictionary of headers.
- **etag** – Optional eTag string.
- **blocking** – Whether to block for asynchronous operations.
- **timeout** – Max time in seconds to wait for blocking async call.
- **extra\_session\_req\_kwargs** – Optional keyword argument to pass requests library arguments which would pass on to requests session object.

**Returns** The response object from the requests library.

**Raises** ConnectionError

**Raises** HTTPError

**post** (*path*=", *data*=*None*, *headers*=*None*, *blocking*=*False*, *timeout*=60,

    \*\**extra\_session\_req\_kwargs*)

HTTP POST method.

#### Parameters

- **path** – Optional sub-URI path to the resource.
- **data** – Optional JSON data.
- **headers** – Optional dictionary of headers.
- **blocking** – Whether to block for asynchronous operations.
- **timeout** – Max time in seconds to wait for blocking sync call.
- **extra\_session\_req\_kwargs** – Optional keyword argument to pass requests library arguments which would pass on to requests session object.

**Returns** The response object from the requests library.

**Raises** ConnectionError

**Raises** HTTPError

**put** (*path*=", *data*=*None*, *headers*=*None*, *blocking*=*False*, *timeout*=60,

    \*\**extra\_session\_req\_kwargs*)

HTTP PUT method.

#### Parameters

- **path** – Optional sub-URI path to the resource.
- **data** – Optional JSON data.
- **headers** – Optional dictionary of headers.
- **blocking** – Whether to block for asynchronous operations.
- **timeout** – Max time in seconds to wait for blocking sync call.
- **extra\_session\_req\_kwargs** – Optional keyword argument to pass requests library arguments which would pass on to requests session object.

**Returns** The response object from the requests library.

**Raises** ConnectionError

**Raises** HTTPError

**set\_auth** (*auth*)

Sets the authentication mechanism for our connector.

**set\_http\_basic\_auth** (*username*, *password*)

Sets the http basic authentication information.

**set\_http\_session\_auth** (*session\_auth\_token*)

Sets the session authentication information.

## sushy.exceptions module

```
exception sushy.exceptions.AccessError(method, url, response)
    Bases: sushy.exceptions.HTTPError

exception sushy.exceptions.ArchiveParsingError(message=None, **kwargs)
    Bases: sushy.exceptions.SushyError

    message = 'Failed parsing archive "%(path)s": %(error)s'

exception sushy.exceptions.BadRequestError(method, url, response)
    Bases: sushy.exceptions.HTTPError

exception sushy.exceptions.ConnectionError(message=None, **kwargs)
    Bases: sushy.exceptions.SushyError

    message = 'Unable to connect to %(url)s. Error: %(error)s'

exception sushy.exceptions.ExtensionError(message=None, **kwargs)
    Bases: sushy.exceptions.SushyError

    message = 'Sushy Extension Error: %(error)s'

exception sushy.exceptions.HTTPError(method, url, response)
    Bases: sushy.exceptions.SushyError

    Basic exception for HTTP errors

    body = None
        Error JSON body, if present.

    code = 'Base.1.0.GeneralError'
        Error code defined in the Redfish specification, if present.

    detail = None
        Error message defined in the Redfish specification, if present.

    extended_info = None
        Extended information provided in the response.

    message = 'HTTP %(method)s %(url)s returned code %(code)s.
              %(error)s Extended information: %(ext_info)s'

    property related_properties
        List of properties related to the error.

    status_code = None
        HTTP status code.

exception sushy.exceptions.InvalidParameterValueError(message=None,
                                                       **kwargs)
    Bases: sushy.exceptions.SushyError

    message = 'The parameter "%(parameter)s" value "%(value)s" is
              invalid. Valid values are: %(valid_values)s'

exception sushy.exceptions.MalformedAttributeError(message=None, **kwargs)
    Bases: sushy.exceptions.SushyError

    message = 'The attribute %(attribute)s is malformed in the
              resource %(resource)s: %(error)s'
```

```
exception sushy.exceptions.MissingActionError(message=None, **kwargs)
Bases: sushy.exceptions.SushyError

    message = 'The action %(action)s is missing from the resource
%(resource)s'

exception sushy.exceptions.MissingAttributeError(message=None, **kwargs)
Bases: sushy.exceptions.SushyError

    message = 'The attribute %(attribute)s is missing from the
resource %(resource)s'

exception sushy.exceptions.MissingHeaderError(message=None, **kwargs)
Bases: sushy.exceptions.SushyError

    message = 'Response to %(target_uri)s did not contain a
%(header)s header'

exception sushy.exceptions.MissingXAuthToken(method, url, response)
Bases: sushy.exceptions.HTTPError

    message = 'No X-Auth-Token returned from remote host when
attempting to establish a session. Error: %(error)s'

exception sushy.exceptions.OEMExtensionNotFoundError(message=None,
                                                       **kwargs)
Bases: sushy.exceptions.SushyError

    message = 'No %(resource)s OEM extension found by name
"%(name)s".'

exception sushy.exceptions.ResourceNotFoundError(method, url, response)
Bases: sushy.exceptions.HTTPError

    message = 'Resource %(url)s not found'

exception sushy.exceptions.ServerSideError(method, url, response)
Bases: sushy.exceptions.HTTPError

exception sushy.exceptions.SushyError(message=None, **kwargs)
Bases: Exception

    Basic exception for errors raised by Sushy

    message = None

exception sushy.exceptions.UnknownDefaultError(message=None, **kwargs)
Bases: sushy.exceptions.SushyError

    message = 'Failed at determining default for "%(entity)s":
%(error)s'

sushy.exceptions.raise_for_response(method, url, response)
Raise a correct error class, if needed.
```

## sushy.main module

```
class sushy.main.LazyRegistries(service_root)
    Bases: collections.abc.MutableMapping

    Download registries on demand.

    Redfish message registries can be very large. On top of that, they are not used frequently. Thus, let's
    not pull them off the BMC unless the consumer is actually trying to use them.

    Parameters service_root (sushy.main.Sushy) – Redfish service root object

    property registries

class sushy.main.ProtocolFeaturesSupportedField(*args, **kwargs)
    Bases: sushy.resources.base.CompositeField

    excerpt_query = <sushy.resources.base.Field object>
        The excerpt query parameter is supported

    expand_query = <sushy.resources.base.Field object>
        The expand query parameter is supported

    filter_query = <sushy.resources.base.Field object>
        The filter query parameter is supported

    only_member_query = <sushy.resources.base.Field object>
        The only query parameter is supported

    select_query = <sushy.resources.base.Field object>
        The select query parameter is supported

class sushy.main.Sushy(base_url, username=None, password=None, root_prefix='/redfish/v1',
                      verify=True, auth=None, connector=None, public_connector=None,
                      language='en')
    Bases: sushy.resources.base.ResourceBase

    create_session(username=None, password=None)
        Creates a session without invoking SessionService.

        For use when a new connection is to be established. Removes prior Session and authentication
        data before making the request.
```

### Parameters

- **username** – The username to utilize to create a session with the remote endpoint.
- **password** – The password to utilize to create a session with the remote endpoint.

**Returns** A session key and uri in the form of a tuple

**Raises** MissingXAuthToken

**Raises** ConnectionError

**Raises** AccessError

**Raises** HTTPError

**Raises** MissingAttributeError

**get\_chassis**(*identity=None*)

Given the identity return a Chassis object

**Parameters** **identity** – The identity of the Chassis resource. If not given, sushy will default to the single available chassis or fail if there appear to be more or less than one Chassis listed.

**Raises** *UnknownDefaultError* if default system can't be determined.

**Returns** The Chassis object

**get\_chassis\_collection()**

Get the ChassisCollection object

**Raises** MissingAttributeError, if the collection attribute is not found

**Returns** a ChassisCollection object

**get\_composition\_service()**

Get the CompositionService object

**Raises** MissingAttributeError, if the composition service attribute is not found

**Returns** The CompositionService object

**get\_event\_service()**

Get the EventService object

**Raises** MissingAttributeError, if the EventService is not found

**Returns** The EventService object

**get\_fabric**(*identity*)

Given the identity return a Fabric object

**Parameters** **identity** – The identity of the Fabric resource

**Returns** The Fabric object

**get\_fabric\_collection()**

Get the FabricCollection object

**Raises** MissingAttributeError, if the collection attribute is not found

**Returns** a FabricCollection object

**get\_manager**(*identity=None*)

Given the identity return a Manager object

**Parameters** **identity** – The identity of the Manager resource. If not given, sushy will default to the single available Manager or fail if there appear to be more or less than one Manager listed.

**Returns** The Manager object

**get\_manager\_collection()**

Get the ManagerCollection object

**Raises** MissingAttributeError, if the collection attribute is not found

**Returns** a ManagerCollection object

**get\_session**(*identity*)

Given the identity return a Session object

**Parameters** `identity` – The identity of the session resource

**Returns** The Session object

**get\_session\_service()**

Get the SessionService object

**Raises** MissingAttributeError, if the collection attribute is not found

**Returns** as SessionCollection object

**get\_sessions\_path()**

Returns the Sessions url

**get\_system(*identity=None*)**

Given the identity return a System object

**Parameters** `identity` – The identity of the System resource. If not given, sushy will default to the single available System or fail if there appear to be more or less then one System listed.

**Raises** UnknownDefaultError if default system can't be determined.

**Returns** The System object

**get\_system\_collection()**

Get the SystemCollection object

**Raises** MissingAttributeError, if the collection attribute is not found

**Returns** a SystemCollection object

**get\_task\_monitor(*task\_monitor\_uri*)**

Used to retrieve a TaskMonitor by task monitor URI.

**Parameters** `task_monitor_uri` – Task monitor URI

**Returns** A task monitor.

**get\_task\_service()**

Get the TaskService object

**Returns** The TaskService object

**get\_update\_service()**

Get the UpdateService object

**Returns** The UpdateService object

**identity = <sushy.resources.base.Field object>**

The Redfish root service identity

**property lazy\_registries**

Gets and combines all message registries together

Fetches all registries if any provided by Redfish service and combines together with packaged standard registries.

**Returns** dict of combined message registries where key is Registry\_name.Major\_version.Minor\_version and value is registry itself.

**name = <sushy.resources.base.Field object>**

The Redfish root service name

**product = <sushy.resources.base.Field object>**

The product associated with this Redfish service

**protocol\_features\_supported =**

**<sushy.main.ProtocolFeaturesSupportedField object>**

The information about protocol features supported by the service

**property registries**

Gets and combines all registries together

Fetches all registries if any provided by Redfish service and combines together with packaged standard registries. Both message and attribute registries are supported from the Redfish service.

**Returns** dict of combined registries keyed by both the registry name (Registry\_name.Major\_version.Minor\_version) and the registry file identity, with the value being the actual registry itself.

**uuid = <sushy.resources.base.Field object>**

The Redfish root service UUID

## sushy.taskmonitor module

**class sushy.taskmonitor.TaskMonitor(connector, task\_monitor\_uri, redfish\_version=None, registries=None, field\_data=None, response=None)**

Bases: object

**property cancellable**

The amount of time to sleep before retrying

**Returns** A Boolean indicating if the Task is cancellable.

**property check\_is\_processing**

Refreshes task and check if it is still processing

**Returns** A boolean indicating if the task is still processing.

**static from\_response(conn, response, target\_uri, redfish\_version=None, registries=None)**

Construct TaskMonitor instance from received response.

**Response** Unprocessed response

**Target\_uri** URI used to initiate async operation

**Redfish\_version** Redfish version. Optional when used internally.

**Registries** Redfish registries. Optional when used internally.

**Returns** TaskMonitor instance

**Raises** MissingHeaderError if Location is missing in response

**get\_task()**

Construct Task instance from task monitor URI.

**Returns** Task instance.

**property is\_processing**

Indicates if the task is still processing

**Returns** A boolean indicating if the task is still processing.

**refresh()**

Refresh the Task

Freshly retrieves/fetches the Task. :raises: ResourceNotFoundError :raises: ConnectionError :raises: HTTPError

**property response**

Unprocessed response.

Intended to be used internally. :returns: Unprocessed response.

**property retry\_after**

The amount of time to sleep before retrying

**Deprecated:** use sleep\_for. This is not working with Retry-After header in date format.

**Returns** The amount of time in seconds to wait before calling is\_processing.

**property sleep\_for**

Seconds the client should wait before querying the operation status

Defaults to 1 second if Retry-After not specified in response.

**Returns** The number of seconds to wait

**property task**

The executing task

**Returns** The Task being executed.

**property task\_monitor**

The TaskMonitor URI

Deprecated: Use task\_monitor\_uri

**Returns** The TaskMonitor URI.

**property task\_monitor\_uri**

The TaskMonitor URI

**Returns** The TaskMonitor URI.

**wait(timeout\_sec)**

Waits until task is completed or it times out.

**Parameters** `timeout_sec` – Timeout to wait

**Raises** ConnectionError when times out

## sushy.utils module

`sushy.utils.bool_or_none(x)`

Given a value x this method returns either a bool or None

**Parameters** `x` – The value to transform and return

**Returns** Either None or x cast to a bool

`sushy.utils.cache_clear(res_selfie, force_refresh, only_these=None)`

Clear some or all cached values of the resource.

If the cache variable refers to a resource instance then the `invalidate()` method is called on that. Otherwise it is set to None. Should there be a need to force refresh the resource and its sub-resources, “cascading refresh”, `force_refresh` is to be set to True.

This is the complimentary method of `cache_it` decorator.

**Parameters**

- `res_selfie` – the resource instance.
- `force_refresh` – `force_refresh` argument of `invalidate()` method.
- `only_these` – expects a sequence of specific method names for which the cached value/s need to be cleared only. When None, all the cached values are cleared.

`sushy.utils.cache_it(res_accessor_method)`

Utility decorator to cache the return value of the decorated method.

This decorator is to be used with any Sushy resource class method. This will internally create an attribute on the resource namely `_cache_<decorated_method_name>`. This is referred to as the “caching attribute”. This attribute will eventually hold the resultant value from the method invocation (when method gets first time called) and for every subsequent calls to that method this cached value will get returned. It expects the decorated method to contain its own logic of evaluation.

This also assigns a variable named `_cache_attr_names` on the resource. This variable maintains a collection of all the existing “caching attribute” names.

To invalidate or clear the cache use `cache_clear()`. Usage:

```
class SomeResource(base.ResourceBase):
    ...
    @cache_it
    def get_summary(self):
        # do some calculation and return the result
        # and this result will be cached.
        return result
    ...
    def _do_refresh(self, force):
        cache_clear(self, force)
```

If the returned value is a Sushy resource instance or a sequence whose element is of type Sushy resource it handles the case of calling the `refresh()` method of that resource. This is done to avoid unnecessary recreation of a new resource instance which got already created at the first place in contrast to fresh retrieval of the resource json data. Again, the `force` argument is deliberately

set to False to do only the “light refresh” of the resource (only the fresh retrieval of resource) instead of doing the complete exhaustive “cascading refresh” (resource with all its nested subresources recursively).

```
class SomeResource(base.ResourceBase):  
    ...  
    @property  
    @cache_it  
    def nested_resource(self):  
        return NestedResource(  
            self._conn, "Path/to/NestedResource",  
            redfish_version=self.redfish_version)  
    ...  
    def _do_refresh(self, force):  
        # selective attribute clearing  
        cache_clear(self, force, only_these=['nested_resource'])
```

Do note that this is not thread safe. So guard your code to protect it from any kind of concurrency issues while using this decorator.

**Parameters** `res_accessor_method` – the resource accessor decorated method.

`sushy.utils.camelcase_to_underscore_joined(camelcase_str)`

Convert camelCase string to underscore\_joined string

**Parameters** `camelcase_str` – The camelCase string

**Returns** the equivalent underscore\_joined string

`sushy.utils.get_members_identities(members)`

Extract and return a tuple of members identities

**Parameters** `members` – A list of members in JSON format

**Returns** A tuple containing the members paths

`sushy.utils.get_sub_resource_path_by(resource, subresource_name, is_collection=False)`

Helper function to find the subresource path

**Parameters**

- `resource` – ResourceBase instance on which the name gets queried upon.
- `subresource_name` – name of the resource field to fetch the ‘@odata.id’ from.
- `is_collection` – if *True*, expect a list of resources to fetch the ‘@odata.id’ from.

**Returns** Resource path (if `is_collection` is *False*) or a list of resource paths (if `is_collection` is *True*).

`sushy.utils.int_or_none(x)`

Given a value x it cast as int or None

**Parameters** `x` – The value to transform and return

**Returns** Either None or x cast to an int

`sushy.utils.max_safe (iterable, default=0)`

Helper wrapper over builtin max() function.

This function is just a wrapper over builtin max() w/o key argument. The `default` argument specifies an object to return if the provided `iterable` is empty. Also it filters out the `None` type values.

#### Parameters

- `iterable` – an iterable
- `default` – 0 by default

`sushy.utils.revert_dictionary (dictionary)`

Given a dictionary revert it's mapping

**Parameters** `dictionary` – A dictionary to be reverted

**Returns** A dictionary with the keys and values reverted

`sushy.utils.sanitize (item)`

Remove passwords from the item.

`sushy.utils.setdefaultattr (obj, name, default)`

Python's `dict.setdefault` applied on Python objects.

If name is an attribute with obj, return its value. If not, set name attribute with a value of default and return default.

#### Parameters

- `obj` – a python object
- `name` – name of attribute
- `default` – default value to be set

`sushy.utils.synchronized (wrapped)`

Simple synchronization decorator.

Decorating a method like so:

```
@synchronized
def foo(self, *args):
    ...

```

ensures that only one thread will execute the foo method at a time.

## Module contents

```
class sushy.Sushy(base_url, username=None, password=None, root_prefix='/redfish/v1',
                   verify=True, auth=None, connector=None, public_connector=None,
                   language='en')
```

Bases: `sushy.resources.base.ResourceBase`

`create_session (username=None, password=None)`

Creates a session without invoking SessionService.

For use when a new connection is to be established. Removes prior Session and authentication data before making the request.

## Parameters

- **username** – The username to utilize to create a session with the remote endpoint.
- **password** – The password to utilize to create a session with the remote endpoint.

**Returns** A session key and uri in the form of a tuple

**Raises** MissingXAuthToken

**Raises** ConnectionError

**Raises** AccessError

**Raises** HTTPError

**Raises** MissingAttributeError

**get\_chassis**(*identity=None*)

Given the identity return a Chassis object

**Parameters** **identity** – The identity of the Chassis resource. If not given, sushy will default to the single available chassis or fail if there appear to be more or less than one Chassis listed.

**Raises** UnknownDefaultError if default system can't be determined.

**Returns** The Chassis object

**get\_chassis\_collection**()

Get the ChassisCollection object

**Raises** MissingAttributeError, if the collection attribute is not found

**Returns** a ChassisCollection object

**get\_composition\_service**()

Get the CompositionService object

**Raises** MissingAttributeError, if the composition service attribute is not found

**Returns** The CompositionService object

**get\_event\_service**()

Get the EventService object

**Raises** MissingAttributeError, if the EventService is not found

**Returns** The EventService object

**get\_fabric**(*identity*)

Given the identity return a Fabric object

**Parameters** **identity** – The identity of the Fabric resource

**Returns** The Fabric object

**get\_fabric\_collection**()

Get the FabricCollection object

**Raises** MissingAttributeError, if the collection attribute is not found

**Returns** a FabricCollection object

**get\_manager** (*identity=None*)

Given the identity return a Manager object

**Parameters** **identity** – The identity of the Manager resource. If not given, sushy will default to the single available Manager or fail if there appear to be more or less then one Manager listed.

**Returns** The Manager object

**get\_manager\_collection** ()

Get the ManagerCollection object

**Raises** MissingAttributeError, if the collection attribute is not found

**Returns** a ManagerCollection object

**get\_session** (*identity*)

Given the identity return a Session object

**Parameters** **identity** – The identity of the session resource

**Returns** The Session object

**get\_session\_service** ()

Get the SessionService object

**Raises** MissingAttributeError, if the collection attribute is not found

**Returns** as SessionCollection object

**get\_sessions\_path** ()

Returns the Sessions url

**get\_system** (*identity=None*)

Given the identity return a System object

**Parameters** **identity** – The identity of the System resource. If not given, sushy will default to the single available System or fail if there appear to be more or less then one System listed.

**Raises** UnknownDefaultError if default system can't be determined.

**Returns** The System object

**get\_system\_collection** ()

Get the SystemCollection object

**Raises** MissingAttributeError, if the collection attribute is not found

**Returns** a SystemCollection object

**get\_task\_monitor** (*task\_monitor\_uri*)

Used to retrieve a TaskMonitor by task monitor URI.

**Parameters** **task\_monitor\_uri** – Task monitor URI

**Returns** A task monitor.

**get\_task\_service** ()

Get the TaskService object

**Returns** The TaskService object

**get\_update\_service()**

Get the UpdateService object

**Returns** The UpdateService object

**identity = <sushy.resources.base.Field object>**

The Redfish root service identity

**property lazy\_registries**

Gets and combines all message registries together

Fetches all registries if any provided by Redfish service and combines together with packaged standard registries.

**Returns** dict of combined message registries where key is Registry\_name.Major\_version.Minor\_version and value is registry itself.

**name = <sushy.resources.base.Field object>**

The Redfish root service name

**product = <sushy.resources.base.Field object>**

The product associated with this Redfish service

**protocol\_features\_supported =**

**<sushy.main.ProtocolFeaturesSupportedField object>**

The information about protocol features supported by the service

**property registries**

Gets and combines all registries together

Fetches all registries if any provided by Redfish service and combines together with packaged standard registries. Both message and attribute registries are supported from the Redfish service.

**Returns** dict of combined registries keyed by both the registry name (Registry\_name.Major\_version.Minor\_version) and the registry file identity, with the value being the actual registry itself.

**uuid = <sushy.resources.base.Field object>**

The Redfish root service UUID

- genindex
